DRBD SURFACE WATER TYPOLOGY

ANNEX 2

Typology of the Danube River

The typology of the Danube River has been developed in a joint activity by the countries sharing the Danube River for the first DBA in 2004. The Danube typology therefore constitutes a harmonised system used by all these countries. The Danube typology was based on a combination of abiotic factors of System A and System B. The most important factors are ecoregion, mean water slope, substratum composition, geomorphology and water temperature.

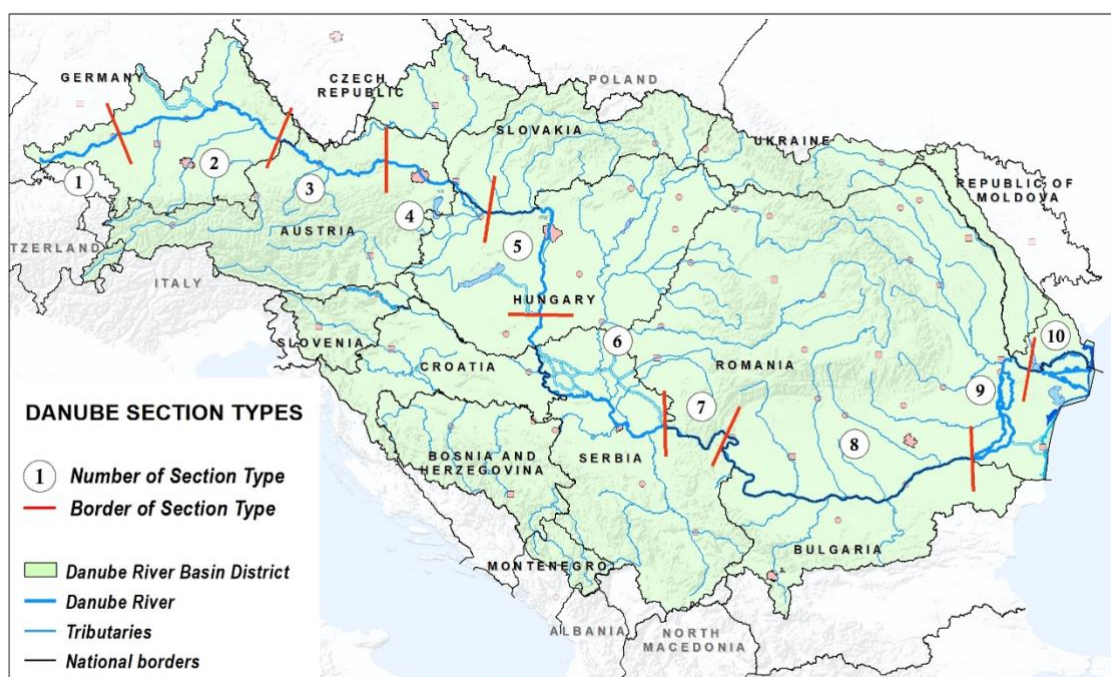

Figure 1: Danube section types; the dividing lines refer only to the Danube River itself.

Table 1: Danube section types

Section Type	Name of the Section Type	from - to
1	Upper course of the Danube	rkm 2786: confluence of Brigach and Breg – rkm 2581: Neu Ulm
2	Western Alpine Foothills Danube	rkm 2581: Neu Ulm – rkm 2225: Passau
3	Eastern Alpine Foothills Danube	rkm 2225: Passau – rkm 2001: Krems
4	Lower Alpine Foothills Danube	rkm 2001: Krems – rkm 1790: Gönyű/Kližská Nemá
5	Hungarian Danube Bend	rkm 1790: Gönyű/ Kližská Nemá – rkm 1497: Baja
6	Pannonian Plain Danube	rkm 1497: Baja – rkm 1075 : Bazias
7	Iron Gate (Cazane) Danube	rkm 1075: Bazias – rkm 943: Turnu Severin
8	Western Pontic (Cazane-Calarasi) Danube	rkm 943: Turnu Severin – rkm 375.5: Chiciu/Silistra
9	Eastern Wallachian (Calarasi-Isacceca) Danube	rkm 375.5: Chiciu/Silistra – rkm 100: Isacceca
10	Danube Delta*	rkm 100: Isacceca – rkm 0 on Chilia arm, rkm 0 on Sulina arm and rkm 0 on Sf. Gheorghe arm

Ten Danube section types were identified (see Figure 1 and Table 1). The morphological and habitat characteristics are outlined for each section type. In order to ensure that the Danube section types are biologically meaningful, these were validated with biological data collected during the first Joint Danube Survey in 2001.

Typology of the tributaries in the Danube River Basin District

The typologies of the Danube tributaries were developed by the countries individually. Stream types relevant on transboundary water courses were bilaterally harmonised with the neighbours.

Most countries in the DRB (Germany, Austria, Czech Republic, Hungary, Slovenia, Bosnia and Herzegovina, Serbia, Croatia, Romania, Bulgaria) have applied System B (Annex II, 1.2.1 WFD) for establishing their river typology. Only Slovakia and Ukraine have used System A. Countries using System B have used a number of optional factors to further describe the river types. River discharge, mean substratum composition and mean water slope are most frequently used.

Table 2 gives an overview of the class boundaries used by the DRB countries for the common descriptors: altitude, catchment area and geology.

Table 2: Obligatory factors used in river typologies (Systems A and B)

Descriptor	Country	Class boundaries						
Altitude	Germany	0-200 m	200-800m		> 800 m			
	Austria	0-200 m	200-500 m	500-800 m	800-1600 m	> 1600 m		
	Czech Republic	0-200 m	200-500 m	500-800 m		> 800 m		
	Slovakia	0-200 m	200-500 m	500-800 m		> 800 m		
	Hungary ¹	slope categories were used in river typology						
	Croatia	0-200 m	200 - 500 m		> 500 m			
	Slovenia	no altitude classes were used in river typology						
	Serbia	0-200 m	200-500 m	> 500 m				
	Romania	0-200 m	200-500 m	> 500 m				
	Bulgaria	0-200 m	200-800 m			> 800 m		
	Bosnia and Herzegovina	< 200 m	200-500 m	500-800 m		> 800 m		
	Republic of Moldova	0-200 m	200-800m			> 800 m		
	Montenegro							
Ukraine	< 200 m	200-500 m		500-800 m				
Catchment area	Germany	10-100 km ²	100-1000 km ²		1000-10,000 km ²	> 10,000 km ²		
	Austria	10-100 km ²	100-500 km ²	500-1000 km ²	1000-2500 km ²	2500-10,000 km ²		
	Czech Republic	Not applied anymore						
	Slovakia ²	10-100 km ²		100 – 1 000 km ²	1000 – 10000 km ²			
	Hungary	10-100 km ²	100-1000 km ²	1000-10,000 km ²	10,000-100,000 km ²	> 100,000 km ²		
	Croatia	10-100 km ²	100-1000 km ²		1000-10,000 km ²	> 10,000 km ²		
	Slovenia	<10 km ²	10-100 km ²	100-1000 km ²	1000-10,000 km ²	> 10,000 km ²		
	Serbia	10-100 km ²	100-1000 km ²		1000-4000 km ²	4000-10,000 km ² > 10,000 km ²		
	Romania	10-100 km ²	100-1000 km ²		1000-10,000 km ²	> 10,000 km ²		
	Bulgaria	10-100 km ²	100-1300 km ²		1300-10,000 km ²	> 10,000 km ²		
	Bosnia and Herzegovina	<100 km ²	100-1000 km ²		1000-4000 km ²	4000-10,000 km ² > 10,000 km ²		
	Republic of Moldova	10-100 km ²	100-1000 km ²		1000-10,000 km ² > 10,000 km ²			
	Montenegro							
Ukraine	10-100 km ²	100-1000 km ²		1000-10,000 km ²	> 10,000 km ²			
Geology	Germany	siliceous		calcareous		organic		
	Austria	crystalline	tertiary and quaternary sediments		flysch and helveticum	limestone and dolomite		
	Czech Republic	crystalline and vulcanites			sandstones, mudstones and quaternary			
	Slovakia	mixed						
	Hungary	siliceous		calcareous				
	Croatia	siliceous		calcareous		organic	mixed	
	Slovenia	siliceous		calcareous			flysch ³	
	Serbia	siliceous		calcareous			organic	
	Romania	siliceous		calcareous			organic	
	Bulgaria	siliceous		calcareous			mixed	
Bosnia and Herzegovina	siliceous		calcareous			organic		

¹ River type-classification of waterbodies based on the slope category more powerful than altitude based on biological validation results (slope categories: <0,15 ‰, 0,15 ‰ - 2,5‰, >2,5‰; real altitude categories are rather 0-150m, 150-350m, >350 m and used as background-information).

² The river typology is not based on strict boundaries of catchment area. Rivers > 1,000 km² make up individual types; definition of types for smaller rivers is based on ecoregion, altitude and geology.

³ not for the tributaries in the Danube river basin district

	Republic of Moldova	siliceous	calcareous	organic
	Montenegro			
	Ukraine	siliceous	calcareous	organic

Lakes

Types for four lakes were reported at the DRB overview level: Neusiedler/Fertő-to (Austria/Hungary), Balaton (Hungary), Ialpug (Ukraine) and Razim/Razelm (Romania). Information is provided in Table 3.

Table 3: Lakes selected for the basin-wide overview and their types

Lakes > 100 km ²	Country(s)	Type of lake	Ecoregion	Altitude class	Depth class	Size class	Geology
Neusiedler See / Fertő-tó	AT, HU	lowland, large shallow, saline lake	2	lowland: < 200 m	< 3 m	> 100 km ²	saline
Lake Balaton	HU	lowland, very large, mid deep, calcareous lake	1	lowland: < 200 m	3-15 m	> 100 km ²	calcareous
Ozero Ialpug	UA	n.a.	12	n.a.	n.a.	> 100 km ²	n.a.
Lacul Razim / Razelm	RO	lowland, very shallow, calcareous, very large lake type	12	lowland: < 200 m	< 3 m	> 100 km ²	calcareous

Transitional and coastal waters

The transitional and coastal waters of the DRB are located in Romania and Ukraine. For the development of the typology of transitional and coastal waters System B was applied. The transitional waters are differentiated into lacustrine and marine transitional waters (Table 4).

Table 4: Types of transitional waters in the DRBD

Transitional water	Type
Lake Sinoe	Transitional lacustrine type
Black Sea coastal waters (northern sector) – Chilia mouth to Periboina	Transitional marine type

Two coastal water types have been defined for the coastal waters in the DRBD (Table 5).

Table 5: Types of coastal waters in the Danube River Basin District

Coastal water	Type
Periboina – Singol Cape	Sandy shallow coastal water
Singol Cape – Vama veche	Mixed shallow coastal water

URBAN WASTEWATER EMISSION INVENTORY

ANNEX 3

Urban wastewater discharge data were collected from the countries in line with the reporting requirements of the UWWTD (non-EU countries used the same template). The data served the assessments of the point source organic substance and nutrient emissions via urban wastewater discharges for the reference year 2018. Summarizing tables of the data submitted are presented in the followings.

INDUSTRIAL EMISSION INVENTORY

ANNEX 4

Industrial pollutant release data were collected from the E-PRTR database (note that some data might have been updated since November 2021) and directly from the countries which do not report under the E-PRTR system. The data served the assessments of the point source organic matter and nutrient emissions via direct industrial dischargers for the reference year 2018. Summarizing tables of the data submitted are presented in the followings.

NUTRIENT EMISSION MODELLING WITH MONERIS

ANNEX 5

Nutrient emissions from point and diffuse sources were calculated with the MONERIS model for the reference period 2015-2018. Summarizing tables of the modelling results are presented in the followings.

Detailed technical information is available: *Nutrient Emissions and Loads in the Danube River Basin - Current situation and scenarios for the 3rd Danube River Basin Management Plan. Final Report, Deliverable of the EU LIFE Project "Support for the Development of the 3rd Danube River Basin Management and 2nd Flood risk Management Plan Update 2021" (LIFE19 PRE AT 006 – LIFE DRBMP DFRMP 2021), IGB, 2021.*

Table 1: Total nitrogen emissions according to countries and pathways in tons N per year

HAZARDOUS SUBSTANCES POLLUTION INVENTORY

ANNEX 6

Hazardous substances release data were collected from the E-PRTR database (note that some data might have been updated since November 2021) and directly from the countries which do not report under the E-PRTR system. The data served the assessments of the point source hazardous substances emissions via direct industrial dischargers for the reference year 2018. Summarizing tables of the data submitted are presented in the followings.

Table 1: Number of industrial facilities and urban wastewater treatment plants with reported direct hazardous substance releases according to industrial sectors and countries

Activity	DE	AT	CZ	SK	HU	SI	HR	BA	ME	RS	BG	RO	MD	UA	Basin
Energy sector	1	4	2	2	3	0	2	4	0	0	0	3	0	0	21

Technical information on the national inventories on priority substances emissions, discharges and losses were collected directly from the countries by a questionnaire. Summarizing tables of the answers are provided in the followings.

Table 6: Answers to Questions 1-4

	Q1	Q2	Q3	Q4
Country	EU MS: what is the current status of the elaboration of the PS EDL inventory and when will the assessments be available? Non-EU MS: is there any similar activity on-going or planned?	Which point sources are involved into the assessments? How are the emissions quantified?	Do you address PS diffuse pollution? How do you assess the diffuse emissions?	Which pollutants/pollutant groups have been involved to the emission assessments?
DE	The second PS EDL inventory for Germany was prepared in December 2019. It comprises methodological aspects as well as values and assessments for all PS. The findings will be published soon in a contribution which will be included in all River Basin Management plans.	Point sources included industrial discharges, municipal discharges, and in the case of the RPA data, emissions from historic mining sites. Sources were: (a) PRTR data from industrial dischargers and municipal point sources (> 100,000 p.e.), if PRTR data were not available for the latter see (b). (b) For discharges from municipal WWTPs > 50 PE, data using emission factors were used (for 11 substances: Cd, Hg, Ni, Pb, Diuron, Isoproturon, DEHP, 4-iso-Nonylphenol, PFOS, Terbutryn, Fluoranthene), based on data from a Germany-wide research project (Toshovski et al. 2020). UWWTD data were used as baseline information. (c) Emissions from historical mining sites are based on monitoring information from the German federal states (for metals only). PRTR data: Measurements or estimates of wastewater concentrations. Municipal wastewater treatment plants: emission factors, if available.	Depending on data availability either the riverine load approach or the regionalised pathway-oriented analysis approach (Cd, Hg, Ni, Pb, PAHs) of CIS Guidance No 28 were used to estimate diffuse emissions. Therefore, the model MoRE (Modelling of Regionalized Emissions) was used.	All PS were considered using the 2-step approach described in CIS Guidance 28. 16 substances were identified as “not relevant” (in the context required in the Guidance) in all ten German RBD. Substances identified as relevant have been involved to further emission assessment.

	Q1	Q2	Q3	Q4
Country	EU MS: what is the current status of the elaboration of the PS EDL inventory and when will the assessments be available? Non-EU MS: is there any similar activity on-going or planned?	Which point sources are involved into the assessments? How are the emissions quantified?	Do you address PS diffuse pollution? How do you assess the diffuse emissions?	Which pollutants/pollutant groups have been involved to the emission assessments?
AT	Status PS EDL: For point sources the Austrian Emission Register for emissions into surface waters EMREG-OW is the basis for the PS EDL supplemented by data from the E-PRTR. First estimates for diffuse emissions were developed within the project "Emissionsabschätzung prioritäre Stoffe". A detailed emission modelling was done within the project "STOBIMO Spurenstoffe". For selected ubiquitous persistent, bioaccumulative and toxic priority (uPBT) substances emissions to surface waters via various pathways were modelled.	The assessment considers urban wastewater treatment plants (UWWTP) as well as industrial facilities and waste disposal systems, discharging directly to surface waters. Emissions from these installations are either reported to the national emissions register EMREG-OW or to E-PRTR or estimated based on monitoring programs. Emissions from UWWTP were documented in the report "Emissionen ausgewählter prioritärer und sonstiger Stoffe aus kommunalen Kläranlagen". Selected uPBT substances were measured in industrial facilities representing the most important industrial activities in AT within the project „STOBIMO Spurenstoffe“. Those measured concentration values have been used in the modelling. In case no measures or emission factors are available for point sources emissions are calculated on base of maximum allowable concentrations (legislation).	Depending on data availability either the riverine load or the regional path analysis approach of CIS Guidance No 28 were used to estimate diffuse emissions. Within the projects "Emissionsabschätzung prioritäre Stoffe" and "STOBIMO Spurenstoffe" a combination of pathway and source-oriented approach was applied. Several pathways for diffuse emissions as direct atmospheric deposition for surface waters, surface runoff, diffuse emissions from urban areas via combined sewer overflows and separate sewer discharges, erosion from natural and agricultural soils as well as groundwater and interflow were included. Load calculation for these diffuse pathways are based on monitoring data. Selected pilot catchment areas were monitored in order to generate data for the AT wide modelling.	All PS were taken into account using the 2-step approach described in CIS Guidance 28. For point source emissions from UWWTP and industrial facilities all emission data reported to EMREG-OW and E-PRTR is assessed. Additionally, all substances identified as relevant for UWWTPs within the project "Emissionen ausgewählter prioritärer und sonstiger Stoffe aus kommunalen Kläranlagen" were considered. The modelling within the project "STOBIMO Spurenstoffe" focussed on uPBT substances as metals (cadmium, lead, nickel, mercury, copper and zinc), PBDE, TBT, PFOS and PAH.
CZ	In the Czech Republic, the PS EDL inventory was developing by the project in the years 2012 to 2014. Assessment is available in the form of certified methodology. The methodology establishes principles for the assessment of emissions impact; it describes the individual steps, from the identification of relevant pollutants in the catchment area, through the analysis of pollution sources and pathways, to the classification of the significance of groups of sources and pathways for individual substances and water bodies.	All known sources of pollution were involved into the assessment (municipal, industrial, combined, diffusion, point and nonpoint sources of pollution). Analysis of the sources and pathways of pollutants used a wide range of data available on a national scale. When emissions data were not available, emission factors were processed (coefficients of substances inputs per unit, designated by expert estimate).	The equation: "Difference of surface water load and point source emissions (- natural background load) = emissions from diffuse sources" is insufficient in some cases. More used is specific knowledge of movement of substances (behaviour substances). E.g. in agriculture: total applied load and pathways (use of emission factor for pathways) up to the pathway coming into surface waters.	There were assessed all priority and priority hazardous substances (Annex X of the Water Framework Directive) and other substances relevant for the Czech Republic (total 79 substances or quality indicators in the project).
SK	Elaboration of the PS EDL inventory is available.	Into assessment industrial facilities, E-PRTR were involved. (UWWTD data lack information on pollution by PS). Point sources emissions were quantified on the base of effluent measurements.	PS diffuse pollution was addressed. Diffuse loads were calculated by formula: $L_{dif} = L_y$ (total riverine load) – D_p (total point source discharge) – L_b (natural background load) The quantification of emissions, discharges and losses was carried out by calculating of the riverine load (by OSPAR, 2004 equation - recommended by technical guidance) and then by linking results with existing information on the pollution sources or eventually with natural background. For metals the natural background concentrations - developed for	Relevance substances for RBD and sub-basins. They were identified on the base of following criteria: i.) the substance causing the failure state of at least one water bodies ii.) the average concentration of the substance is over half EQS in more than one waterbody

	Q1	Q2	Q3	Q4
Country	EU MS: what is the current status of the elaboration of the PS EDL inventory and when will the assessments be available? Non-EU MS: is there any similar activity on-going or planned?	Which point sources are involved into the assessments? How are the emissions quantified?	Do you address PS diffuse pollution? How do you assess the diffuse emissions?	Which pollutants/pollutant groups have been involved to the emission assessments?
			each of the WB, were taken into account. In case of synthetic substances - for level of background concentration, half of the limit of quantification (0,5LOQ) have been used.	iii.) Data from E-PRTR and national Central water database (SEV) confirm the release, which could lead to a concentration corresponding to the above criteria, iv.) there are known sources and activities causing inputs to the basin that could lead to a concentration corresponding to the above criteria.
HU	The compilation of the inventory is still ongoing. Final results will be available by December of 2021.	UWWTPs, Industrial facilities. Industrial facilities - every facility with above 15 m ³ wastewater discharge/operative days, not just E-PRTR UWWTP - > effluent measures, industrial facilities effluent measures, and for metals also used emission factors.	Hungary takes into consideration loads from air deposition, groundwater and transportation. By air deposition we used data from European Monitoring and Evaluation Programme (EMEP) and Corine Land Cover. And also, we take account our air deposition monitoring program results. To assess loads from groundwater we took the estimated interflow and ps. concentrations of the infiltration area. By loads of transportation we used the number of motor vehicles and emission factors of toxic metal loads from break wear, tire wear and exhaust gases.	Due to the results of the chemical status assessment we tried to consider all the relevant substances. Depending on the substance it resulted in different detailed inventories.
SI	Summary of the PS EDL inventory is part of national RBMP.	In the assessment industrial facilities and UWWTPs data are included. For UWWTP > 100.000 PE the emissions were quantified using values reported in E-PRTR system. For the UWWTP < 100.000 PE and for industrial facilities annual reports of emission monitoring (effluent measurements) performed were used.	Evaluation of emissions from diffuse sources depends on data availability and takes into account the CIS Guidance No 28.	PS, PHS and pollutants relevant on the national level were involved.
HR	The compilation of the inventory is still ongoing. Summary of the PS EDL inventory will be available in national RBMP.	Point sources included industrial and municipal discharges. Emission from industrial and municipal discharges are based on measurements of wastewater concentrations or using emission factors.	Evaluation of emissions from diffuse sources depends on data availability and takes into account the CIS Guidance No 28.	PS, PHS and pollutants relevant on the national level were involved.
BA			No information available.	
ME			No information available.	
RS	There is no established inventory of emissions, discharges and losses. Currently, SEPA is developing and maintaining PRTR register in Serbia. From 2011, SEPA voluntarily report to the EEA E-PETR priority data flow. Serbian PRTR register was established in 2008 and in	All point sources subject to water permit, which means sewage systems and/or WWTPs and industrial facilities (PRTR facilities), are obligated to deliver a report on wastewater emissions, providing the concentrations of PS in wastewater, although the number and the quality of the reports are still not	No. PS diffuse pollution has not evaluated due to lack of adequate data.	Heavy metals, together with total phosphorus and nitrogen, are pollutants that are mostly represented and involved in emission assessment.

	Q1	Q2	Q3	Q4
Country	EU MS: what is the current status of the elaboration of the PS EDL inventory and when will the assessments be available? Non-EU MS: is there any similar activity on-going or planned?	Which point sources are involved into the assessments? How are the emissions quantified?	Do you address PS diffuse pollution? How do you assess the diffuse emissions?	Which pollutants/pollutant groups have been involved to the emission assessments?
	<p>2010 was harmonized with the EU Regulation 166/2006, except for reporting thresholds. All PRTR facilities must report all emissions regardless to the reporting thresholds. All facilities which have obligation to report to Serbian PRTR register submit the relevant reports by means of the established information system. All pollutants prescribed by e-PRTR Protocol, with regard to the activity of the facility, are being reported to SEPA, and PRTR Report delivered to European Agency has only emissions above prescribed limit values. The data collection and reporting system has been improved gradually to cover all releases and transfers to all media covered by the E-PRTR Regulation. Separately, there is Cadastre of polluters which contains register, permits and technical and other documentation on sources of pollution, quantity and type of emission, as well as information on recipients.</p>	<p>satisfying. Emissions are delivered based on measurements, estimates or calculation.</p>		
RO	<p>Romania has established the EDL inventory based on the EU Guidance no. 28 “Technical Guidance on the Preparation of an Inventory of Emissions, Discharges and Losses of Priority and Priority Hazardous Substances”. The last inventory developed included the analysis of EDL from 2017-2019. This assessment/result of the inventory is part of the draft of the National Management Plan-2021 and of the draft River Basin Management Plans-2021 (at sub-unit level).</p>	<p>In Romania all point sources which are subject of water management license have been analysed in the inventory (i.e. urban waste waters and industrial waters) if priority substances were discharged. The concentrations in effluent have been measured and the PS load has been calculated.</p>	<p>The estimation of diffuse sources contribution was calculated (as difference between the total annual riverine load and the point source load).</p>	<p>Emission assessments were made only for relevant PS at the basin/sub-basin unit.</p>
BG	<p>The PS EDL inventory for Bulgaria was prepared in 2016 based on the EU Guidance no. 28 “Technical Guidance on the Preparation of an Inventory of Emissions, Discharges and Losses of Priority and Priority Hazardous Substances”.</p>	<p>According to the guidelines for determining the mass load of pollutants in wastewater from point sources of pollution in the inventory of emissions, discharges and losses of priority substances and some other pollutants are taken into account the following data: from the monitoring of wastewater from the sites forming waste water, including treatment plants in settlements, including self-monitoring of permit holders, as well as reported data, in accordance with the obligation of operators listed in Annex I to Regulation № 166/2006 establishing a European Pollutant Release and Transfer Register (E-PRTR), to report data on the release and transfer of pollutants listed in Annex II of the Regulation.</p>	<p>An approximate estimate of the diffuse pollution from priority substances, calculated as an arithmetic difference between the calculated load of the surface water body and the emissions from point sources of pollution.</p>	<p>All PS were taken into account using the 2-step approach described in CIS Guidance 28. In the calculations data on the concentrations of the substances from the conducted monitoring of the surface waters from the “Water Monitoring Information System” were used and industrial facilities all emission data reported to E-PRTR is assessed. Five priority substances, four heavy metals - mercury, lead,</p>

	Q1	Q2	Q3	Q4
Country	EU MS: what is the current status of the elaboration of the PS EDL inventory and when will the assessments be available? Non-EU MS: is there any similar activity on-going or planned?	Which point sources are involved into the assessments? How are the emissions quantified?	Do you address PS diffuse pollution? How do you assess the diffuse emissions?	Which pollutants/pollutant groups have been involved to the emission assessments?
		<p>The calculation of the mass load of pollutants in the wastewater is based on the available data from the conducted own monitoring of the sites with discharge permits or complex permits, including the amount of wastewater and the concentration of emitted pollutants, as well as the data from the control monitoring. At concentrations of the substance below the limit of determination, ½ LOQ was used in the calculations.</p> <p>The mass load of pollutants in wastewater from point sources is calculated by multiplying the average annual concentration of the respective pollutant by the annual amount of discharged wastewater.</p>		nickel, cadmium and 1,2 - dichloroethane were inventoried.
MD	<p>In 2016 the e-PRTR register has been developed, aimed for the companies to report and for the public to get information about activities, types of pollutions, sources, etc.</p> <p>In 2018, the Regulation regarding the National Register of pollutant release and transfer was approved by GD #.373/ 2018. This Regulation addressed the basis for establishing of an automated national system with data on pollutant emissions into water, air, etc. to be reported by operators carrying out one or more activities.</p>	In currently reported wastewater statistics, the emissions are counted on the basis of influent-effluent measures.	<p>Currently, due to some objective reasons, the established Register is not officially handed over to the Environmental Agency which is a body responsible for its administration.</p> <p>By the time being, the Register contains some info collected during its elaboration before 2018, and only few of them relate to emission into water from operators situated out of Danube basin.</p>	None.
UA	The only National Inventory of Pollutant Emissions operates by the time being. This inventory contains data on all substances, including PS. Monitoring begun in one river basin in 2019. In 2021 PS monitoring cover all other 7 river basin for 37 substances.	<p>Point sources facilities (UWWTP and industry) which are subject of water management license are considered.</p> <p>Industrial facilities - every facility with above 20 m3 wastewater discharge.</p> <p>Point sources emission are calculated on the base of effluent concentrations.</p>	Diffuse pollution is calculated as Total river load – Point sources emissions.	Emission assessments are made only for relevant PS at the basin/sub-basin unit.

Table 7: Answers to Questions 5-8

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
DE	Most of the PS were measured at surveillance monitoring sites (mostly in water samples, sometimes also in suspended solid material). Especially the new substances were only rarely monitored yet. Most measurements were done at regular stations.	Using the 2-step approach described in the CIS Guidance No 28 two ubiquity substances were identified as “relevant” in all German RBD (Hg, BDE). 14 substances are “relevant” in more than two German RBD. The main results will be published soon.	Several analytical problems have been encountered. For example, normal sampling times for emission monitoring programs are too short to provide a robust long-term average signal need-ed for load calculations. Sometimes the quantitation limit was not low enough to produce inventory data. The WFD sample preparation is not consistent for certain substances. Heavy metals are analysed as filtered sample for the status assessment, but as unfiltered sample for the inventory calculation. As is to be expected, the results differ. Similar problems exist for substances for which only biota standards are specified. For many substances, there is a lack of reliable environmental data to characterize diffuse emission pathways (groundwater, atmospheric deposition, erosion, urban wastewater systems).	Further analytical method development is necessary for some substances in order to meet the requirements of the EQS Directive and its national implementation (OGewV). There is a need for harmonisation in planning and implementation of monitoring programs in the German federal states. The existing data base should be further expanded through coordinated and harmonized research work. In view of the high priority of diffuse input pathways and the current data situation, further efforts must be made to im-prove the data basis as well as to further develop the tools for substance input modelling.
AT	Different pollutant groups are monitored regularly or in specific monitoring campaigns. Most of the PS were measured at surveillance monitoring sites in water or in biota samples. For Heavy metals the data frequency is appropriate for load calculations (12 per year) in single years. However, data above the detection limit are sparse for some substances, hindering the appropriate calculation of loads. Some pollutants (e.g. pesticides) are measured only in specific campaigns. Some PS, for which biota EQS are defined, are monitored in biota only. For those substances the calculation of appropriate riverine loads is not possible.	Nutrients and some ubiquity substances are in the focus: Tributyltin; PAH; mercury; PBDE and PFOS (Draft RBMP 2021).	The availability of resilient data for PS in different diffuse pathways (e.g. deposition, groundwater; erosion) are the most important gaps in Austria related to the inventory compilation.	Point source discharges have to meet the requirements of the branch specific emission ordinances (Abwasseremissionsverordnungen). For most relevant/ problematic PS as uPBT substances the dominant emissions derive from diffuse sources and one major emission is via erosion. Reducing erosion also reduces EDL of uPBT substances to surface waters. In the draft version of the NGP (National water management plan) no specific measures are foreseen for the most problematic uPBT substances mercury and PBDE.
CZ	The monitored indicators are deriving according to the requirements of the National Monitoring Program, which be accepted by the Ministry of the Environment and the Ministry of Agriculture. In the monitored	Problematic is mainly the content of some heavy metals, PAH components and pesticides.	Knowledge about the loads of surface waters by priority substances coming from different diffuse pathways - derivation of emission factors.	-

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
SK	<p>water bodies, where the measurement frequency is sufficient, you can calculate the load. In some cases (seasonal emission fluctuations), the measurement frequency needs a specific approach.</p> <p>Priority substances and substances relevant for SK. Mostly surveillance and operational monitoring. For assessment of chemical status are measured all priority substances, frequency is one in month, 12 per year. River basin specific pollutants are measured in the relevant water bodies, where are discharged.</p>	<p>Following the requirements of the European Water Framework Directive (WFD), a process of selecting relevant dangerous substances and developing a related Pollution Reduction Programme (PRP) has started in the Slovakia in 2001. Based on the results of a three years investigative screening campaign, 59 chemical substances were identified as relevant dangerous substances in 2004 and included in the national PRP. From this list of 59 chemical substances, 33 priority substances were already included in the EQS Directive (2008/105/EC). The remaining 26 relevant dangerous substances were assigned as river basin specific pollutants (Annex VIII substances of the WFD) for the Slovakia. Priority substances relevant for Danube RBD belongs 21 substances:</p> <ol style="list-style-type: none"> 1. Alachlor 2. Atrazine 3. Cadmium and its compounds 4. Cyclodiene pesticides 5. para-para-DDT 6. Bis(2-ethylhexyl)- phthalate (DEHP) 7. Endosulfan 8. Fluoranthene 9. Hexachlorobenzene 10. Hexachlorobutadiene 11. Hexachlorocyclohexane 12. Lead and its compounds 13. Mercury and its compounds 14. Naphthalene 15. Nonylphenol (4-nonylphenol) 16. Octylphenol ((4-(1,1',3,3'-tetramethylbutyl)phenol)) 17. Pentachlorobenzene 18. Pentachlorophenol 19. Polyaromatic hydrocarbons (PAH) 20. Tetrachlorethylene 	<ul style="list-style-type: none"> • insufficiently precise analytical methods for determining some substances as required by Directive 2009/90 / EC laying down further to Directive 2000/60 /EC of the EP and a number of technical requirements for chemical analysis and monitoring of water status • absence of data on the concentrations of PS and SK relevant substances (identified in 2008) in sediment and biota, • insufficient scope of monitoring quality of discharged waste water in relation to PS and SK relevant substances (legislation lacks a tool for compulsory periodic updating of indicators of the pollution - monitoring the full range of PS and SK RS as part of the renewal of the authorization for the discharge of wastewater) • lack of data on air pollution, specific organic substances (PS, SK RS) • comparability of water contamination by heavy metals in the stream, and the wastewater discharges. Issued permits for waste water discharge prescribe- the limit values for total form (bound, not only to water but also of suspended solids), in contrast to the requirements for the chemical status of water bodies - where EQS apply to the filtered water. Therefore, it is presently difficult to estimate the contribution from point and diffuse source in the total riverine load. • insufficient information about the content of PL and RL pollution in municipal wastewater. 	<p>For identified sources of pollution (point and diffuse) measures were proposed. In addition to improve future PS EDL inventory following measures were proposed:</p> <ul style="list-style-type: none"> • reducing the limits LOQ laid down in the case of methods which do not meet the LOQ required by Directive 2010/108 / EC, respectively a switch to other matrix setting of relevant indicators, • introduce monitoring of the organic matter in the monitoring of emissions to air, • creating tools to increase the level of future emissions inventories (e.g. Models, data on the production and use of substances – e.g. REACH, from the analysis of substance cycles, production and emission factors).

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
		<p>21. Trichloromethane (chloroform)</p> <p>From SK relevant substances (identified in 2008) 10 substances are relevant for Danube RBD:</p> <ol style="list-style-type: none"> 1. 2-methyl-4-chlorophenoxyacetic acid (MCPA), 2. 4-metyl-2,6-di-terc butylphenol, 3. arsenic and its compounds, 4. Dibutyl phthalate, 5. phenanthrene, 6. Chromium and its compounds 7. cyanides, 8. copper and its compounds, 9. PCB and its congeners (28, 52, 101, 118, 138, 153,180), 10. zinc and its compounds. 		
HU	We used mainly the data of surveillance monitoring stations (12 samples/year), and many operational and investigative monitoring program results. Quantity and quality of monitoring data was almost sufficient.	We have many problems with PBTs (almost all of it), PAHs and Cd.	<p>Estimations on diffuse loads have significant uncertainty. Mainly from historical pollution sources e.g. diffuse emission from soil via erosion. Many of cross border influent water bodies are in bad status, but we have lack of information about emission source on the upstream catchments.</p> <p>Other problem is heterogenic monitoring data and information gap on priority substances emission coming from UWWT.</p> <p>Emission and immission data cannot be compared because the measured parameters are different. By metals the emission site measures the total amount yet the immission only the dissolved. Pesticides and organic compounds are measured as components, but by emissions we have got only parameter group data: halogenated organic compounds, or PAHs etc.</p>	<p>Between measures provided for river basin management plan there are many which consider supplementary monitoring (UWWTPs, industrial facilities).</p> <p>We plan investigate monitoring programs for better describing emission pathways e.g. soil and air depositions, and UWWTP and chemical industry discharge monitoring to get more information on PS discharges.</p>
SI	One year during the RBMP period the surveillance monitoring on surveillance monitoring stations is being performed. In this surveillance monitoring mostly/mainly the whole set of priority substances is included.	Some substances are found as being relevant at the basin/sub-basin unit.	The lack of tools to estimate diffuse sources of pollution (such as pesticides/biocides from agricultural activities, illegal landfills, pollution from urban areas, storm overflows).	The requirements of the national legislation have to be fulfilled.

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
	On the other (regular) monitoring stations or during the other 5 years of the RBMP period the priority substances are being measured as circumstances require with regard to emissions, discharges and findings of the previous monitoring (if any excess over the quality standard is being measured, we confirm it or annul it in the next years with proceeded monitoring). On principle specific campaigns are not performed, exceptionally for the purpose of the investigative monitoring. The frequency of priority substances measurement is in line with the WFD (12 times/year).			
HR	All Priority substances and substances relevant for HR. Mostly surveillance and operational monitoring. For assessment of chemical status are measured all priority substances, frequency is one in month, 12 per year. River basin specific pollutants are measured in the relevant water bodies, where are discharged.	We have problems with PBTs in biota (Hg, BDE).	The lack of tools to estimate diffuse sources of pollution (such as urban areas, storm overflows).	The requirements of the national legislation have to be fulfilled.
BA			No information available.	
ME			No information available.	
RS	In 2021, 54 prescribed priority substances were monitored through operational monitoring together with additional 32 that were chosen based on results from previous years. Frequency of monitoring varies depending on waterbody, from 4 to 12 times per year. Due to insufficient financial and human capacity, monitoring still doesn't cover all designated water bodies in RS.	In the Environmental Status Report, heavy metals are pointed out as relevant.	Main gap is insufficient data pool due to lack of human and financial resources. Also, the lack of information on diffuse emissions, no established system on gathering data on agricultural use of priority substances, landfill pollution, etc.	In the draft version of the RBMP proposed measures are implementation IED regulates and key measures: phasing-out / reduction of emissions, discharges and losses of PS, remediation of contaminated sites (historical pollution including sediments, groundwater, soil), upgrades or improvements of industrial wastewater treatment plants and research, improvement of knowledge base reducing uncertainty.

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
RO	The monitoring of emissions of priority substances (included in Annex 1 of the Directive 2013/39/EU) was performed taking into account the existence of analysis methods, the type of wastewater discharged (taking into account the specific field of activity from which they come), but also the presence (identification) of these substances in the water body. For C10-C13-chloroalkanes, no method was available. Tributyltin compounds, dioxins, and dioxin-type compounds are not analysed because the method held and applied involves high risks of use/operation for personnel. Monitoring data are coming from regular monitoring according to the WFD requirements. Sampling and analysis is usually conducted with frequencies of 12 times per year. The frequency of monitoring data is appropriate for annual riverine load calculation.	Heavy metals are found as being relevant at the basin/sub-basin unit. The relevance step was based on the criteria EU Guidance no. 28.	The main gaps are the followings: lack of tool to estimate the diffuse emissions, lack in certain cases of point sources and frequent of diffuse sources, there was not possible the assign a certain substance found in the aquatic environment to an appropriate source.	The measures proposed are designed for reduction of a number of substances (e.g. heavy metals).
BG	Pollutants from the group of Priority Substances, Annex 1 of EC Directive 2008/105 have been measured. The results are from the planned / conducted control and operational monitoring with a frequency of 12 / year, according to the monitoring program. Pollutants from the same group of Priority Substances have been measured and used in the assessment, but with a frequency of 1 to 4 times a year at the points of discharge of industrial plants and treatment plants, which are defined in the plans for own monitoring approved by the Danube Basin Directorate.	For all heavy metals in the group of priority substances, emissions from point sources of pollution have decreased for the period 2009-2015. The substance 1,2-dichloroethane was not detected in 2015. For heavy metals cadmium, lead and nickel, emissions from diffuse sources of pollution have decreased for the period 2009-2015. The substance 1,2-dichloroethane in 2015 and as a diffuse source is not detected.	At the time of the inventory process, some of the PS / 4 in number / are not analyzed due to undeveloped in the EEA methodologies for analysis. Some priority substances do not have a set of 12 samplings and a correspondingly lower number of results within a year due to bad weather conditions (monitoring stations are high in the mountains). Lack or insufficiently correct monitoring of the quantities of discharged wastewater.	Mercury emissions through diffuse pollution have increased and as a result, expanded monitoring of mercury in the other two matrices is planned - biota and sediment for the period of RBMP 2016-2021, seeking additional information from the analysis of priority substances.
MD	In the frameworks of Feasibility Study, there were preliminary identified HS relevant for entire Republic of Moldova, as well as facilities emitting HS. Thus, on the nationwide level, there were identified next relevant to PRTR industrial sectors fall under the Protocol's requirements according to capacity thresholds: energy (3 facilities), production and processing of metals (1 facility), mineral	Particular HS of national importance were not identified yet.	Institutional constrains & lack of funds.	None.

	Q5	Q6	Q7	Q8
Country	Which pollutants/pollutant groups have been measured in the water bodies? What kind of monitoring is used? Is the data frequency appropriate for load calculations?	What particular substances have been found of national importance?	What are the most important problems/gaps identified related to the inventory compilation?	Have specific measures been recommended to control PS emissions?
	<p>industry (ac. 19 facilities), chemical industry/ pharmaceutical (1 facility), waste and waste water management (4-5 facilities, from which 1 landfill, and 3-4 UWWTPs), paper production and processing (2 facilities), intensive livestock production, etc. However, it shall be mentioned that not even one UWWTP or industrial facility with exceeding threshold values was identified in the Moldovan part of the Danube basin</p> <p>Besides, there were identified the following officially reported to national statistics HS: N tot., P tot., As, Cd, Cr, Cu, Pb, Ni, Hg, Zn, DDT, Benzene, Phenols, PAH, chlorides, and cyanides.</p> <p>For the monitoring are used both regular stations and specific campaigns. In fact, Hydrometeorological Service regularly monitors in rivers 73 chemical parameters, including heavy metals, organic substances, organochlorine pesticides and PAH. Data frequency is appropriate for load calculation.</p>			
UA	<p>37 from the 45 PS are measured at surveillance monitoring sites. Frequency is one in month, 12 per year.</p>	<p>Screening of water samples and bottom sediments is performed to determine the list of specific synthetic and non-synthetic pollutants in 3 river basins. List of hazardous substances in wastewater from enterprises was compiled based on national industry standards; special investigations</p> <p>Pollutant groups are: 21 pesticides (some of which were banned in EU), trace metals, polyaromatic hydrocarbons (PAH), trichloromethane, pentachlorobenzene.</p>	<p>The main gaps are the followings: insufficiently precise of analytical measurements for determining some substances, absence data in sediments and biota, lack of tool to estimate the diffuse emissions constrains & limited funds.</p>	<p>No specific measures have been recommended.</p>

Hazardous substances concentration data in wastewater effluents were collected and analysed in the framework of the SOLUTIONS project (<https://www.solutions-project.eu/>). The data served the assessments of the toxicity risk of the released substances. Summarizing tables of the analysis results are presented in the followings.

Data on Accident Hazard Sites were collected directly from the countries. Data on Tailings Management Facilities were collected by the Danube TMF project and confirmed by the Danube countries (except SI and RS, for these countries data are preliminary). The data served the assessments of the accident hazard of operating industrial sites and the hazard and risk of the tailings ponds. Summarizing tables of the data submitted are presented in the followings.

Detailed technical information on Accident Hazard Sites is available: Inventory of Potential Accidental Risk Spots in the Danube River Basin, Technical report, ICPDR (2001), <http://www.icpdr.org/main/issues/accidental-pollution>.

Detailed technical information on Tailings Management Facilities is available: Safety of the Tailings Management Facilities in the Danube River Basin, Technical Report, UBA (2020), https://www.umweltbundesamt.de/sites/default/files/medien/5750/publikationen/2020_11_30_texte_185-2020_danube_river_basin_0.pdf.

Table 14: Number of AHS, summed stored volume of substances and total WHI of the Danube countries

No relevance for Germany, Austria, Croatia, Moldova and Ukraine.

LIST OF FUTURE INFRASTRUCTURE PROJECTS

ANNEX 7

As in previous cycles, a list of future infrastructure projects (FIPs) of basin-wide importance has been compiled for the DRBMP Update 2021. The following criteria were applied for the data collection.

Criteria for the collection of future infrastructure projects for the Danube River and other DRBD rivers with catchment areas >4,000 km²

	Danube River	Other DRBD rivers with catchment areas >4,000 km²
Criteria	Strategic Environmental Assessment (SEA) and/or Environmental Impact Assessments (EIA) are performed for the project	Strategic Environmental Assessment (SEA) and/or Environmental Impact Assessments (EIA) are performed for the project
	<u>or</u>	<u>and</u>
	project is expected to provoke transboundary effects	project is expected to provoke transboundary effects

These FIPs, if implemented without full consideration to effects on water status, are likely to provoke impacts on water status due to hydromorphological alterations. Consequently, these projects need to be addressed by integrating mitigation measures in order to reduce/cancel the potential impacts on water status.

Explanation of abbreviations for the tables

EIA = Environmental Impact Assessment

SEA = Strategic Environmental Assessment

WFD = Water Framework Directive

Country	River or Coastal Waterbody	Water body	Project title	Main purpose	Description	Project status	Start implementation	Expected deterioration of water body status	Trans-boundary impact	SEA	EIA	Exemption WFD Art. 4(7)
BG	Dunav	BG1DU000R001	Fast Danube Sector 7 Belene	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location 1 km north of Belene; between km 577 and km 560	Implementation of project	2021	Yes	Yes	No	Intended	Yes*
BG	Dunav	BG1DU000R001	Fast Danube Sector 8 Vardim	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location 5 km northeast of Vardim; between km 542 and km 539	Implementation of project	2021	Yes	Yes	No	Intended	Yes*
BG	Dunav	BG1DU000R001	Fast Danube Sector 9 Yantra	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location: 3 km north of Krivina; between km 537 and km 534	Implementation of project	2021	Yes	Yes	No	Intended	Yes*
BG	Dunav	BG1DU000R001	Fast Danube Sector 10 Batin	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location: 2 km north of Batin; between km 530 and km 520	Implementation of project	2021	Yes	Yes	No	Intended	Yes*
BG	Dunav	BG1DU000R001	Fast Danube Sector 11 Konsui	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location 6 km east of Oltenita; between km 428 and km 423	Implementation of project	2021	Yes	Yes	No	Intended	Yes*

Country	River or Coastal Waterbody	Water body	Project title	Main purpose	Description	Project status	Start implementation	Expected deterioration of water body status	Trans-boundary impact	SEA	EIA	Exemption WFD Art. 4(7)
BG	Dunav	BG1DU000R001	Fast Danube Sector 12 Popina	Navigation	Improvement of the navigation conditions on the RO-BG Danube Sector - Location: 1 km north of Popina; between km 408 and km 401	Implementation of project	2021	Yes	Yes	No	Intended	Yes*
DE	Donau	DERW_DEBY_1_F361	Ausbau der Wasserstraße und Verbesserung des Hochwasserschutzes zwischen Straubing und Vilshofen, Teilabschnitt 1: Straubing bis Deggendorf	Navigation ¹	Improvement of flood protection (technical measures for 100-year flood events), Improvement of navigation conditions (River engineering works - stream regulation)	Implementation of project	2020	No	No	No	Already done	No
DE	Donau	DERW_DEBY_1_F477	Ausbau der Wasserstraße und Verbesserung des Hochwasserschutzes zwischen Straubing und Vilshofen, Teilabschnitt 2: Deggendorf bis Vilshofen	Navigation ¹	Improvement of flood protection (technical measures for 100-year flood events), Improvement of navigation conditions (River engineering works - stream regulation)	Planning under preparation	Not yet determined	No	Yes	No	Already done	No
HR	Kupa	HRCSRN0004_001, HRCSRN0004_002, HRCSRN0004_003, HRCSRN0004_004, HRCSRN0004_005, HRCSRN0004_006, HRCSRN0004_007, HRCSRN0004_008	Projekt "Sustav zaštite od poplava karlovačko-sisačkog područja"	Flood protection	Projekt "Sustav zaštite od poplava karlovačko-sisačkog područja"	Officially planned	2020	No	No	Already done	Already done	No

¹ Future infrastructure projects can have multiple purposes, e.g. the main purpose of the project "Straubing-Vilshofen" in Germany is twofold: improvement of flood protection, and navigation.

* The EIA study in relation to the Fast Danube Project (including the Impact Assessment on Water Bodies) is an ongoing process, and only its completion will conclude if a WB deterioration will take place or not.

** Data reported for RS is not based on an official WFD Article 4(7) application as there is no transposition of WFD exemptions in national water law yet.

*...GWBs overlying

Explanation to Table 1 and 2

Transboundary GWB	ICPDR GWB code which is a unique identifier and the name
Nat. part	Code of national shares of ICPDR GWB
National GWB Codes	National codes of the individual GWBs forming the national part of a transboundary GWB of basin wide importance.
Area	Whole area of the transboundary GWB covering all countries concerned / Area of national shares in km ²
Aquifer characterisation	Aquifer Type: Predom. P = porous/ K = karst/ F = fissured. Multiple selections possible: Predominantly porous, karst, fissured and combinations are possible. Main type should be listed first. Confined: Yes / No
Main use	DRW = drinking water / AGR = agriculture / IRR = irrigation / IND = Industry / SPA = balneology / CAL = caloric energy / OTH = other. Multiple selection possible.
Overlying strata	Indicates a range of thickness (minimum and maximum in metres)
Criteria for importance	If size < 4 000 km ² criteria for importance of the GW body have to be named, they have to be bilaterally agreed upon.

Table 3: Number of monitoring stations and density per GWB

Explanation to Table 3

Transboundary GWB	ICPDR GWB code which is a unique identifier and the name
Nat. part	Code of national shares of ICPDR GWB
Area	Area of the whole transboundary ICPDR GWB covering all countries concerned and of the national shares of the ICPDR GWB in km ² .
CHEMICAL / QUANTITY	
Sites	Number of monitoring sites – Reference year (AT/DE 2018/19, BG 2016/19, RO 2017/19, SK 2018)
km²/site	Area in km ² represented by each site – Reference year (AT/DE 2018/19, BG 2016/19, RO 2017/19, SK 2018)
Number of sites bilaterally agreed for data exchange	Number of monitoring sites for which transboundary data exchange is bilaterally agreed.
Associated to	
Drinking water protected areas	Number of monitoring sites associated to drinking water protected areas
Ecosystems	Number of monitoring sites associated to ecosystems

Table 4: Parameters and frequency for the surveillance monitoring program

	AT/DE	BG	RS	HU	MD	RO	SK
Transboundary GWB	1	2, 4	7	5 – 12	3	2 – 7	8 – 12
CHEMICAL (with estimation of frequency)							
Oxygen	1/a	>1/a	1/a	1/6; <1/a		1/a***	>1/a
pH-value	1/a	>1/a	1/a	>1/a*		1/a	>1/a
Electrical conductivity	1/a (cont. DE)	>1/a	1/a	>1/a*		1/a	>1/a
Nitrate	1/a	>1/a	1/a	>1/a*		1/a	>1/a
Ammonium	1/a	>1/a	1/a	>1/a*		1/a	>1/a
Temperature	cont.	>1/a	1/a	>1/a*		1/a	>1/a
Further parameters, e.g. major ions	x**	x	1/a	x		x	x
operational							
		x		x		x	x
QUANTITY (with estimation of frequency)							
GW levels/well head pressure	x	x	x	x		x	x
spring flows		x		x		x	x
Flow characteristics							x
Extraction (not obligatory)	x						
Reinjection (not obligatory)	x						

Remarks:

Transboundary GWB:	Code of transboundary GWB of Danube basin wide importance
>1/a:	More than 1 per year
x:	Parameter is measured
*...	In the starting year
**...	A yearly program and a five year monitoring program were established. Further parameters in DE are chloride, sulphate and total hardness
***...	Monitoring frequency is according to surveillance monitoring program. The frequency is >1/year (2/y) in case of operational monitoring program

Explanation to Table 5 and Table 6

GWB	ICPDR GWB code which is a unique identifier.	
Nat. part	Code of national shares of ICPDR GWBs	
Danube RBM Plan 2015	Danube RBM Plan 2021	
[Chemical/Quantitative] Status 2015	Status 2021	Good / Poor / Unknown
Status Pressure Types 2015	Status Pressure Types 2021	Indicates the significant pressures causing poor status in 2015. AR = artificial recharge, DS = diffuse sources, PS = point sources, OP = other significant pressures, WA = water abstractions
Significant upward trend (parameter)	Significant upward trend (parameter)	Indicates for which parameter a significant sustained upward trend has been identified.
Trend reversal (parameter)	Trend reversal (parameter)	Indicates for which parameter a trend reversal could have been achieved.
Risk 2013→2021	Risk 2019→2027	Risk / - (which means 'no risk')
Risk Pressure Types →2021	Risk Pressure Types →2027	Indicates the significant pressures causing risk of failing to achieve good status in 2021. AR = artificial recharge, DS = diffuse sources, PS = point sources, OP = other significant pressures, WA = water abstractions
Exemptions from 2021	Exemptions (Year of achievement)	Indicates the year by when good status is expected to be achieved.

Methodologies of status and trend assessment of the ICPDR GW-bodies

GWB-1: Deep Groundwater Body – Thermal Water

GWB-1	National share	AT-1 DE-1	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	AT	ATGK100158	Good	Good
	DE	DEGK1110	Good	Good
Description/Characterisation of the ICPDR GW-body	<p><i>The thermal groundwater of the Malm karst (Upper Jurassic) in the Lower Bavarian and Upper Austrian Molasse Basin is of transboundary importance. It is used for spa purposes and to gain geothermal energy. The geothermal used water is totally re-injected in the same aquifer.</i></p> <p><i>The transboundary GW-body covers a total area of 5,900 km²; the length is 155 km and the width is up to 55 km. The aquifer is Malm (karstic limestone); the top of the Malm reaches a depth of more than 1,000 m below sea level in the Bavarian part and 2,000 m in the Upper Austrian part. The groundwater recharge is mainly composed of subterranean inflow of the adjacent Bohemian Massif and infiltration of precipitation in the northern part of the GWB area. The total groundwater recharge was determined to 820 l/s. The GW-body is selected as of basin-wide importance because of its intensive use. An expert group takes care for the permanent bilateral exchange of information and a sustainable transboundary use.</i></p>			
Description of status assessment methodology.	<p>Chemical Status</p> <p><i>The chemical status of the deep GWB will be described on the basis of measurement and analysis data according to a procedure agreed between the two states. The decisive parameters for the evaluation of the qualitative status of near-surface GWBs (such as nitrate and pesticides) are not relevant for deep GWBs. As expected, the parameters measured in the GWB extending over 5900 km² differ (in some cases considerably) from site to site. This is due to regionally different geo-hydraulic conditions. Therefore the description of the qualitative status cannot be made in the same way as that for near-surface GWBs (on the basis of aggregated data), but made on the basis of measurement and analysis data available at every individual measuring site. Contrary to near-surface GWBs, it should be considered that, due to the utilization of the waters (balneological and thermal uses), good status is not only not achieved if the concentration of certain contents rises above a certain level, but also if it falls below it.</i></p> <p><i>The available data is presently not sufficient to identify precisely enough the scope of fluctuations relevant for individual parameters at the individual measuring sites.</i></p> <p><i>Good chemical status is considered to be reached if the threshold value (TV) of the decisive parameters neither exceed nor fall below the scope of fluctuations determined for every measuring site. It is planned to examine the current selected scope of fluctuations on the basis of many years of monitoring, (at least over a period of 10 years) and to adapt them, where required.</i></p> <p><i>In any case, the GWB is considered to be in a good chemical status if at least 75% of the measuring sites meet good status.</i></p> <p><i>The following parameters are used as a basis for the determination of the qualitative status of the deep GWB: temperature, electrical conductivity, total hardness, sulphate and chloride.</i></p> <p>Quantitative Status</p> <p><i>No Changes since 2009</i></p> <p><i>There is no interaction between deep groundwater and surface waters and/or terrestrial ecosystems.</i></p> <p><i>The quantitative status of the deep GWB can be described by means of:</i></p> <ul style="list-style-type: none"> - <i>the identification of trends over a period of many years monitoring of the level of hydraulic pressure at groundwater measuring sites and wells;</i> - <i>a balancing calculation: a comparison between the thermal water supply and thermal water abstractions.</i> <p><i>Apart from Bad Füssing (records since 1948), no long-term monitoring of pressure potentials that would be significant for a trend analysis is available.</i></p> <p><i>As early as in 1998, detailed thermal water balancing was carried out for the deep GWB. In the course of this balancing an exploitation of the available thermal water resources by thermal water abstractions of about 25% was recorded, which corresponds to a good quantitative status (at least 30% of the quantity available).</i></p> <p><i>In the meantime, the extent of utilisation has been considerably reduced due to successfully implemented management measures (among other things the obligation to reinject the used thermal water exclusively).</i></p>			

	<p><i>Good quantitative status could be even further improved on the basis of the level of hydraulic pressure in the thermal waters of Bad Füssing which has risen again since then.</i></p> <p><i>With a view to the regionally uneven distribution of the available quantity, water abstraction points and abstracted water quantities, a sub-division of the balance area into sub-areas can be made. For these areas the decisive balance parameters can be determined separately</i></p>				
Groundwater threshold value relationships	No changes since 2015

GWB-2: Upper Jurassic – Lower Cretaceous GWB

GWB-2	National share	BG-2, RO-2	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	BG-2	BG1G0000J3K051	Good	Good
	RO-2	RODL06	Good	Good
Description/C characterisation of the ICPDR GW-body	<p>Bulgaria: The starting point for identifying the geographical boundaries of the GWB BG1G0000J3K051 (Upper Jurassic-Lower Cretaceous) is the geological boundaries. After that additional sub-division on the basis of groundwater flow lines and piezometric heads. The lithological composition of GWB is: limestones, dolomitic limestones and dolomites. Overlying strata consists of marls, clays, sands, limestones, pebbles and loess. The age of the above mentioned deposits is Hauterivian, Sarmatian, Pliocene and Quaternary. With the exception of small cropped out areas the GWB is very well protected. There is no significant impact on the GWB. The main use of groundwater is for drinking water, agriculture and industry supply.</p> <p>Romania: Criteria for delineation is development of Upper Jurassic-Lower Cretaceous permeable deposits and water content in these deposits. The lithological composition is limestones, dolomitic limestones and dolomites. Overlying strata consists of marls, clays, sands, limestones, pebbles and loess. The age of the above mentioned deposits is Hauterivian, Sarmatian, Pliocene and Quaternary.</p> <p>Groundwater body RODL06- Valachian Platform has great extension and partially covers Valah platform. It is a transboundary water body of great potential, the depth aquifer having partially a free level (in the sector adjacent to the Danube) and is quartered in calcareous formations, sometime fissured and karstic, with regional extension in the whole South Dobrogea. These deposits are characterized by a hydraulic communication through an aquitard.</p> <p>From the geological point of view, this aquifer complex has a complex structure, being divided by a system of major older than the Sarmatian fault with orientations approximately NNE-SSW and WNW-ESE.</p> <p>Excluding small cropped out areas the GWB is very well protected. The main use is for drinking water supply, agriculture and industry supply. In Romania the GWB has an interaction with Lake Siutghiol situated near the Black Sea.</p> <p>The criterion for selection as 'important' is for both GWBs the size which exceeds 4,000 km²</p>			
Description of status assessment methodology.	<p><u>Chemical Status</u></p> <p>Bulgaria: Assessment of the chemical status of groundwater has been done by carrying out the following tests and steps:</p> <p>GQA-Test: General assessment of the chemical status of GWB.</p> <p>Step 1: Calculation of arithmetic means per monitoring point (MP) for each indicator for the period 2017-2020. Values below LoQ are replaced by ½ LoQ.</p> <p>Step 2: Comparison of arithmetic means with the lowest QS or TVs (EQS, intrusion of salt or polluted waters, drinking water standard or other).</p> <p>Step 3: Assessment of the chemical status in the area of the MP:</p> <ul style="list-style-type: none"> - If for all indicators, the status is "good", then the GWB in the area of the MP is "good"; - If for one or more indicators, the status is "poor", then the GWB in the area of the MP is "poor". In this case, a careful analysis was carried out of the primary hydrochemical data. If the data are doubtful or insufficiently reliable, the indicator (indicators) are rejected from the final assessment and a respective justification for this is presented. <p>Step 4: If in the areas of all MP the status is good, the GWB is determined 'good' and no other tests are needed.</p> <p>Step 5: The confidence of the assessment is determined by the following criteria:</p> <ul style="list-style-type: none"> - Density of the monitoring points in GWB: low (1 MP on area > 200 km²); medium (1 MP on area 50–200 km²), high (1 MP on area <50 km²); - Data have to meet the following requirements: All analytical methods are validated in accordance with standard BDS EN ISO / IEC-17025 or other equivalent internationally 			

	<p><i>recognized standard. Accredited laboratories shall ensure minimum criteria for all applied analytical methods. Minimum length of the time series.</i></p> <p>Step 6: <i>The extent of exceedance was calculated. If the status is determined as "poor" for one or more indicators in one or more MP, then an assessment of the affected area was performed.</i></p> <ul style="list-style-type: none"> - <i>Based on the conceptual model, it is determined whether the MP (points) is (are) located in the recharge zone or in the transit zone or in the drainage zone of GWB.</i> - <i>The areas of GWB in which the average annual concentrations of pollutants exceed QS or TV have been delineated. Each area of GWB affected by pollution includes the area located between the MP where QS or TV have been exceeded. Further, a 1 km buffer zone was delineated around this zone or around the contaminated MP.</i> <p>Step 7: <i>If the polluted area is more than 20% of the total area of the GWB, the confidence assessment was made according step 5.</i></p> <p>Step 8: <i>The places of the exceedances are connected with the groundwater receptors. Depending on the identified locations and GW receptors, relevant tests have been applied: saline or other intrusion, surface water bodies with deteriorated status, GW directly dependent terrestrial ecosystems, drinking and household water supply located at polluted area.</i></p> <p>Step 9: <i>Local conceptual models have been developed for each exceedance point considering the possibility for the pollutant to move through the GWB, identification of pressures, additional trend assessment.</i></p> <p><i>A GWB is in good chemical status when the extent of exceedance is less than 20% and the remaining tests show that: the quality of groundwater used for drinking and domestic water supply has not deteriorated, the GW status-related to surface waters and terrestrial ecosystems (directly dependent of GW) has not deteriorated and there is no intrusion of salt or polluted waters; no significant and sustainable upward trends in concentrations of pollutants and pollution indicators have been identified.</i></p> <p>Romania: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p><i>The first step was to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs have been recorded, the groundwater body has been considered as being in good chemical status. If exceedances of TVs were recorded the following relevant tests were carried out:</i></p> <ul style="list-style-type: none"> • <i>General assessment of the chemical status: Data aggregation was performed and it was checked whether the total area of exceedance was greater than 20% of the total area of the GWB. The test showed a good status for the water body if no exceeding occurs.</i> • <i>Saline or other intrusion: not relevant.</i> • <i>Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: The location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters. A comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test showed a good status for the water body.</i> • <i>Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test showed a good status for the water body;</i> • <i>Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality. The test showed a good status for the water body.</i> <p><i>To assess the chemical status of the groundwater bodies, the following steps are considered:</i></p> <ul style="list-style-type: none"> • <i>for each monitoring point the annual average concentrations for each indicators was calculated; for the metals the concentration of the dissolved form was considered;</i> • <i>For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).</i>
--	--

	<ul style="list-style-type: none"> • The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point. • The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface. <p><u>Quantitative Status</u></p> <p>Bulgaria: The assessment considered data from national and self-monitoring of groundwater abstraction facilities according to the issued permits. The main criteria for assessing good quantitative status are the exploitable (available) groundwater resources of GWB and the groundwater level. To verify compliance with the requirements of the WFD, various tests were performed. The assessment was based on data from 2017–2020 and trends were assessed, with data from 2007–2020. The following tests were performed:</p> <ul style="list-style-type: none"> - Water balance test: the assessment of the GW level downward trend is an indication that, the available GW resources were exceeded and the GWB is in poor status. - Surface water test and terrestrial ecosystem test: both not applicable in BG-2 as surface water bodies and terrestrial ecosystems are not associated/connected. - Saline intrusion test: not relevant <p>Romania: The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account the CIS Guidance no.18. The following criteria have been used:</p> <ul style="list-style-type: none"> • water balance • the connection with surface waters • the influence on the terrestrial ecosystems which depend directly on the GWB • the effects of saline or other intrusions <p>The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average during the whole observation period</p>
Groundwater threshold value relationships	<p><u>Receptors considered:</u></p> <p>Romania: Drinking Water standards</p> <p>Bulgaria: Drinking Water standards</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</u></p> <p>Romania: The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting. As described above, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where NBL are smaller than MAC. Where NBL are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB ($TV = NBL + 0.2 NBL = 1.2 NBL$).</p> <p>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for GWBs from Romania.</p> <p>Bulgaria: The methodology for TV determination in Bulgaria has been developed according to CIS Guidance No. 18. TVs are determined by comparing NBLs with criterial values (CVs). CVs is the concentration of a pollutant (without taking into account the NBLs), which, if exceeded, could lead to a distortion of the criteria for good status. CVs should take into account the risk assessment and receptors of groundwater.</p> <p>The NBL were established for each GWB as a result of the project report 'Assessment of the natural hydrochemical background of the substances composition of groundwater in Bulgaria' (GEOFUND V-402), 1998' NBLs are available for Ca, Mg, SO₄, Cl, HC0₃, Total hardness, Cu, Pb, Zn, As, Fe, F, Al, Mn, Cr, Co, V, J, Ag, Ni, Na, K.</p> <p>The NBLs were determined for each hydrogeological classes (5 classes) in the 90th percentile and 50th percentile (median) of the statistical sample.</p> <p>Criterial values (CVs) have been drinking water standards according to the Bulgarian Regulation N-9.</p> <p>When $NBL > CV$, the TV is equal to NBL.</p> <p>When $CV > NBL$, the $TV = NBL + K_{tv} * (CV - NBL)$. $0 < K_{tv} < 1$</p>

	<p><i>K_{tv} is usually between 0.5 and 0.75, as recommended and providing reasonable assurance. K_{tv} <0.5 has a large certainty and is used for GWBs, which have important economic significance and are the sole source of drinking water supply of settlements. This value should be used for such GWB to which they are attached particularly valuable wetlands presence of dependent PA terrestrial ecosystems. The higher value (0.75) is used in all other cases or GWBs already classified bodies at risk.</i></p>
<p>Verbal description of the trend assessment methodology</p>	<p>Bulgaria: The trend analysis is based on recognized statistical methods such as regression method and a time series of data from 2012 to 2019 (using annual values, semi-annual or quarterly values).</p> <p>Based on regression analysis is assessed whether there is a break in the trend i.e. after sustained upward trend follows sustained downward trend or the opposite case the sustained downward trend is followed by sustained upward trend.</p> <ul style="list-style-type: none"> • Initially, the entire curve of the experimental data is approximated by a polynomial curve of degree 2 (quadratic regression curve). • If there is detected a maximum in the polynomial curve it means that a change of the direction of the trend is available - from ascending to descending. • If there is detected a minimum in the polynomial curve it means that a change of the direction of the trend is available - from descending to ascending. • Then, (in case of available maximum) the entire curve is divided into two branches: 1st branch – till the date of the maximum and the second branch - after the peak. • In case with available minimum: 1st branch – till the date of the minimum and the second branch - after the minimum. • Data from the first and second branch are considered separately and are approximated by linear trends (straight lines). The date at which it crossed the two approximating straight lines corresponds to the date at which it changes the direction of the linear trend - from ascending to descending or from descending to ascending <p>By extrapolation of the second (falling) trend can be predicted date at which the starting concentration (75% GWQS in our case 60% TV) will be reached</p> <p>Romania: In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 17 years (2000–2017).</p> <p>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program.</p> <p>The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2017) • Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000 • Calculation of annual average for the available data in each monitoring point • Significant upward trends were identified by Gwstat software, based on Anova Test
<p>Verbal description of the trend reversal assessment methodology</p>	<p>Bulgaria: The starting point for trend reversal should be placed where the concentration of the pollutant reaches 75% of the groundwater quality standard or 75% of the threshold value of the relevant pollutant. Selected starting points should be possible to reverse trends in the most effective way before pollutant concentrations can cause irreversible changes in groundwater quality. When we have GWB who responds too slowly to changes, there may be a need for an early starting point and vice versa - for responsive GWB should be chosen starting point at a later moment.</p> <p>Initially, the entire curve of the experimental data is approximated by a polynomial curve of degree 2 (quadratic regression curve).</p> <p>If there is detected a maximum in the polynomial curve it means that a change of the direction of the trend is available - from ascending to descending.</p> <p>If there is detected a minimum in the polynomial curve it means that a change of the direction of the trend is available - from descending to ascending.</p>

	<p><i>Then, (in case of available maximum) the entire curve is divided into two branches: 1st branch – till the date of the maximum and the second branch - after the peak</i></p> <p><i>In case with available minimum: 1st branch – till the date of the minimum and the second branch - after the minimum.</i></p> <p><i>Data from the first and second branch are considered separately and are approximated by linear trends (straight lines). The date at which it crossed the two approximating straight lines corresponds to the date at which it changes the direction of the linear trend - from ascending to descending or from descending to ascending</i></p> <p><i>By extrapolation of the second (falling) trend can be predicted date at which the starting concentration (75% GWQS in our case 60% TV) will be reached .Practically for the second RBMP we have used 60 % from the TV.</i></p> <p>Romania: <i>Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</i></p> <ul style="list-style-type: none"> • <i>optimizing the choice of time sections regarding the shape of the resulting model</i> • <i>examining the significance of the rift for the simple linear regression model based on the square of the residue sum</i> • <i>conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model.</i>

GWB-3: Middle Sarmatian - Pontian GWB

GWB-3	National share	MD-3 RO-3	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)		MDPR01	Good	Good
		ROPR05	Good	Good
Description/C haracterisation of the ICPDR GW-body	<p>Romania: The criteria for delineation of the GWB was the development of the Sarmatian aquifer deposits on the territories of Neamt, Bacau and Vaslui districts, situated in the Siret and Prut River Basins. Lithologically, the water-bearing deposits are constituted of sands and sandstones thin layer. Geologically, the wells have pierced the following sub-stages of the Sarmatian: Buglovian, Volhynian, Basarabian and Chersonian. The wells data have indicated that the Sarmatian deposits thickness is highly variable, going from 295 m (Iaşi) to 886 m (Bârlad). It is considered that the Sarmatian deposits unconformably overlay the Late Badenian ones, because the Early Buglovian is lacking. The upper boundary of Sarmatian, respectively the Sarmatian-Meotian boundary, is difficult to assign due to the lack of sure paleontological elements.</p> <p>Lithologically, the water-bearing deposits are constituted of thin layers with fine towards medium grain-size (sands, rarely gravels), sometimes with lens aspect, situated at depth of 30–350 meters.</p> <p>Hydrogeologically and hydrochemically, the investigation of wells data has revealed important areal differences, of quantitative and qualitative order, both horizontally and vertically. The differences of quantitative order are especially due to the Sarmatian deposits grain size.</p> <p>The overlying strata is represented by clay of about 50 meters thickness.</p> <p>The groundwater is mainly used for drinking water supply, agricultural and industrial supplies. The criterion for selection as “important” consists in its size that exceeds 4,000 km².</p> <p>Republic of Moldova: Criteria for delineation are: geological boundaries; groundwater flow lines; chemical and one quantitative status; GWB vulnerability; surface-groundwater interaction. The MD GWB consists of five deep aquifers.</p> <p><u>Silurian - Cretaceous aquifer (S-K2)</u> is spread on the whole territory of the basin and it is used for centralized water supply only in the northern part of the basin. Groundwater is contained in limestone, sandstone, with interlayers of Silurian marls and argilites with total thickness varying from 50-60 m to 100-120 m. Water bearing capacity of the aquifers vary in a wide range. Dominating values of hydraulic conductivity and transmissivity are rather low ($K=0.12-0.37$ m/day, $K_m=10-50$ m²/day). The chemical composition of the Silurian-Cretaceous aquifers is heterogenous. In the northern part of the basin fresh groundwaters with mineralisation <1g/l and dominating hydrocarbonate-sulphate-calcium-magnesium ions are detected. Going to the south chemical composition of the aquifer the characteristics is changing to hydrocarbonate-sulphate-sodium and hydrocarbonate sodium type and the amount of total dissolved solids increases to 2-10 mg/l.</p> <p><u>Baden-Sarmatian aquifer (N1b-s)</u> is the most productive and most important for centralized water supply. Water-bearing layers are represented by limestone with interlayers of fine grained sand, sometimes clays, marls and gypsum. Thickness of the aquifer reaches 50 m, in some places up to 90 m, with average thickness of about 25 m. In the northern part of the basin water bearing</p>			

	<p><i>sediments outcrop to the pre-Quaternary surface and these areas coincide with the recharge zones of the aquifer. Groundwater is discharging into the valley of Prut's tributaries. Southwards Baden-Sarmatian aquifer occurs deeper and near the village Gotesti it was detected by drilling at the depth of 572 m. Hydraulic properties of the aquifer are rather poor. Hydraulic conductivity reaches 1–12 m/day, with mean values of 5 m/day, transmissivity is also low – only 5–20 m²/day. Capacity of wells varies in a range of 0.09–8 l/s.</i></p> <p><i>When water bearing rocks are composed of limestones they contain fresh or slightly mineralised hydrocarbonate-calcium-sodium water with mineralization below 1 g/l. Such areas, however, are rather scarce and groundwaters with mineralization above 1 g/l are prevailing in the basin.</i></p> <p><i><u>Upper Sarmatian Meotic aquifer system (N1s3-m)</u>, which can be included in this GWB is only partially exploited for groundwater abstraction in the southern part of the river basin. Sarmat-Meotis deposits in the area are represented by fine-grained sands and clay with the lenses of quartz sand with total thickness of the aquifer 60–70 m. This sand is water-bearing and contains good quality water. The thickness of water bearing layers is 4–5 m. Yields of exploitation wells vary between 3 and 7 m³/h. Waters from the aquifer system are supplying the needs of several enterprises. Near the Prut river valley yields of the wells increase to 10 m³/h with the drawdown of up to 30 m. This aquifer contains hydrocarbonate-sodium waters with total mineralization of 1–1.5 g/l. In some areas chemical composition changes to sulphate-hydrocarbonate-sodium and mineralization increases to 2 g/l. Hydraulic parameters of the aquifer are rather poor: hydraulic conductivity varies between 0.8–5 m/day with mean values of 2.3 m/day and transmissivity changes in a range of 10–25 m²/day, mean being 5 m²/day.</i></p> <p><i>Groundwater monitoring results over three wells for the period from 2005 to 2009 indicate a decrease in the level of groundwater. The rate of decrease is 0.5–1.4 meter per year. This can be attributed to an increase in the water abstraction from the operating wells located in the vicinity.</i></p> <p><i><u>Middle Sarmatian (Congeriev) aquifer (N1s2)</u> is used for a centralised water supply in the southern part of Republic of Moldova. Groundwater is contained in fine-grained sands with interlayers of clays, sandstones and limestones. Thickness of water bearing sediments varies from 5–15 m to 40–50 m with mean values of 20–30 m. Hydraulic properties of water bearing sands are quite poor. Hydraulic conductivity changes from 0.6 to 1.9 m/day average being 1.3 m/day. Transmissivity values are also very low and do not exceed 20–50 m²/day. Depth to groundwater aquifer depends on the landscape and varies from 1.5 to 100 m. Yields of wells vary from 5 to 75 l/s. When hydrocarbonate-sulphate-chloride anions dominate in groundwater its mineralisation is below 1.5 g/l. When chloride–hydrocarbonate and sodium ions prevail total mineralization increases up to 2 g/l. Monitoring of the aquifer indicates a slight decrease in groundwater level with the rate of 0.4–0.65 m/a.</i></p> <p><i><u>Pontian aquifer (N2p)</u> is spread in the southern part of Republic of Moldova. Water bearing sediments are composed of sandy clays with interlayers of sand and shell limestone with the total thickness of 70–80 m. Prevailing hydraulic properties of water bearing sands are rather poor. Hydraulic conductivity changes from 3.5–3.7 with mean values of 3 m/day. Transmissivity coefficient varies between 18–45 m²/day in some places (e.g. Giurgiulesti village) increasing to 250–260 m²/day. Depth to groundwater aquifer depends on the landscape and varies from 2 to 125 m. Yields of wells vary from 1.1–2.3 l/s, increasing southwards to 3.7–7.6 l/s. Near the village of Taraklia few springs are discharging into Prut river valley with the capacity of 8–9 l/sec. Aquifer contains fresh groundwater with mineralisation <1 g/l (figure 2.6) and prevailing ions of hydrocarbonate -sulphate-chloride-sodium, sometimes sulphate –hydrocarbonate-sodium.</i></p> <p><i>Groundwater from this aquifer is used for drinking and agricultural water supply.</i></p>
Description of status assessment methodology.	<p><u>Chemical Status</u></p> <p>Republic of Moldova: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p>Romania: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p><i>The first step was to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs have been recorded, the groundwater body has been considered as being in good</i></p>

	<p><i>chemical status. If exceedances of TVs were recorded the following relevant tests were carried out:</i></p> <ul style="list-style-type: none"> • <i>General assessment of the chemical status: Data aggregation was performed and it was checked whether the total area of exceedance was greater than 20% of the total area of the GWB. The test showed a good status for the water body if no exceeding occurs.</i> • <i>Saline or other intrusion: not relevant.</i> • <i>Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: The location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters. A comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test showed a good status for the water body.</i> • <i>Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test showed a good status for the water body;</i> • <i>Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality. The test showed a good status for the water body</i> <p><i>To assess the chemical status of the groundwater bodies, the following steps are considered:</i></p> <ul style="list-style-type: none"> • <i>for each monitoring point the annual average concentrations for each indicator was calculated; for the metals the concentration of the dissolved form was considered;</i> • <i>For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).</i> • <i>The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point.</i> • <i>The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface.</i> <p><u>Quantitative Status:</u></p> <p><i>Republic of Moldova:</i> <i>The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account the CIS Guidance № 18</i></p> <p><i>Romania:</i> <i>The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account the CIS Guidance № 18. The following criteria have been used:</i></p> <ul style="list-style-type: none"> • <i>water balance</i> • <i>the connection with surface waters</i> • <i>the influence on the terrestrial ecosystems which depend directly on the GWB</i> • <i>the effects of saline or other intrusions</i> <p><i>The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average levels during the whole period.</i></p>
Groundwater threshold value relationships	<p><u>Receptors considered:</u></p> <p><i>Romania:</i> <i>Drinking Water standards</i></p> <p><i>Republic of Moldova:</i></p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</u></p> <p><i>Romania:</i> <i>The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting. As described previously, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where natural background levels (NBL) are smaller than MAC.</i></p>

	<p>Where background levels are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB ($TV = NBL + 0.2 NBL = 1.2 NBL$).</p> <p>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for groundwater bodies from Romania.</p>
Verbal description of the trend assessment methodology	<p>Republic of Moldova: In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 22 years (1996-2018).</p> <p>Romania: In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 17 years (2000-2017).</p> <p>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program.</p> <p>The steps used for trend assessment were:</p> <ul style="list-style-type: none"> Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2017) Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000 Calculation of annual average for the available data in each monitoring point Significant upward trends were identified by Gwstat software, based on Anova Test
Verbal description of the trend reversal assessment methodology	<p>Romania: Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</p> <ul style="list-style-type: none"> optimizing the choice of time sections regarding the shape of the resulting model; examining the significance of the rift for the simple linear regression model based on the square of the residue sum; conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model.

GWB-4: Sarmatian GWB

GWB-4	National share	BG-4 RO-4	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	BG-4	BG1G000000N049	Good	Good
	RO-4	RODL04	Poor (nitrates)	Good
Description/Characterisation of the ICPDR GW-body	<p><i>The starting point for identifying the boundaries of the GWB BG1G000000N049 Sarmatian is the geological boundaries. The lithological composition of water-bearing deposits is as follows:</i></p> <ul style="list-style-type: none"> - <i>in Bulgaria: limestones, sands;</i> <p><i>Overlying strata consists of loess and loesses clays and clays. The age of the above mentioned deposits is Quaternary. The GWB is vulnerable with cropped out regions of limestones and sandstones or covered with loess. GWB main use is for drinking water supply, agriculture and industry supply.</i></p> <p>Romania: <i>Criteria for delineation are the development of Sarmatian permeable deposits and water resources in these deposits. The lithological composition of water-bearing deposits is oolitic limestones and organogenic limestone.</i></p> <p><i>Overlying strata consists of loess and clays. The GWB is well protected in the clay covered areas, but is vulnerable to pollution in pre-dominantly loess and sands covered areas. This explains nitrate contamination in some areas.</i></p> <p><i>GWB main use is for drinking water supply, and also agricultural and industrial purposes. The main pressures are agriculture activities, waste landfills and less industrial plants.</i></p> <p><i>The criterion for selection as "important" is the size, which exceeds 4000 km².</i></p>			
Description of status assessment methodology.	<p><u>Chemical Status</u></p> <p>Bulgaria: <i>Assessment of the chemical status of groundwater has been done by carrying out the following tests and steps:</i></p> <p><i>GQA-Test: General assessment of the chemical status of GWB.</i></p> <p><u>Step 1:</u> <i>Calculation of arithmetic means per monitoring point (MP) for each indicator for the period 2017-2020. Values below LoQ are replaced by 1/2 LoQ.</i></p> <p><u>Step 2:</u> <i>Comparison of arithmetic means with the lowest QS or TVs (EQS, intrusion of salt or polluted waters, drinking water standard or other).</i></p> <p><u>Step 3:</u> <i>Assessment of the chemical status in the area of the MP:</i></p> <ul style="list-style-type: none"> - <i>If for all indicators, the status is "good", then the GWB in the area of the MP is "good";</i> - <i>If for one or more indicators, the status is "poor", then the GWB in the area of the MP is "poor". In this case, a careful analysis was carried out of the primary hydrochemical data. If the data are doubtful or insufficiently reliable, the indicator (indicators) are rejected from the final assessment and a respective justification for this is presented.</i> <p><u>Step 4:</u> <i>If in the areas of all MP the status is good, the GWB is determined 'good' and no other tests are needed.</i></p> <p><u>Step 5:</u> <i>The confidence of the assessment is determined by the following criteria:</i></p> <ul style="list-style-type: none"> - <i>Density of the monitoring points in GWB: low (1 MP on area > 200 km²); medium (1 MP on area 50–200 km²), high (1 MP on area <50 km²);</i> - <i>Data have to meet the following requirements: All analytical methods are validated in accordance with standard BDS EN ISO / IEC-17025 or other equivalent internationally recognized standard. Accredited laboratories shall ensure minimum criteria for all applied analytical methods. Minimum length of the time series.</i> <p><u>Step 6:</u> <i>The extent of exceedance was calculated. If the status is determined as "poor" for one or more indicators in one or more MP, then an assessment of the affected area was performed.</i></p> <ul style="list-style-type: none"> - <i>Based on the conceptual model, it is determined whether the MP (points) is (are) located in the recharge zone or in the transit zone or in the drainage zone of GWB.</i> 			

- The areas of GWB in which the average annual concentrations of pollutants exceed QS or TV have been delineated. Each area of GWB affected by pollution includes the area located between the MP where QS or TV have been exceeded. Further, a 1 km buffer zone was delineated around this zone or around the contaminated MP.

Step 7: If the polluted area is more than 20% of the total area of the GWB, the confidence assessment was made according step 5.

Step 8: The places of the exceedances are connected with the groundwater receptors. Depending on the identified locations and GW receptors, relevant tests have been applied: saline or other intrusion, surface water bodies with deteriorated status, GW directly dependent terrestrial ecosystems, drinking and household water supply located at polluted area.

Step 9: Local conceptual models have been developed for each exceedance point considering the possibility for the pollutant to move through the GWB, identification of pressures, additional trend assessment.

A GWB is in good chemical status when the extent of exceedance is less than 20% and the remaining tests show that: the quality of groundwater used for drinking and domestic water supply has not deteriorated, the GW status-related to surface waters and terrestrial ecosystems (directly dependent of GW) has not deteriorated and there is no intrusion of salt or polluted waters; no significant and sustainable upward trends in concentrations of pollutants and pollution indicators have been identified.

Romania: The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.

The first step is to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs are recorded, the groundwater body is considered as being in good chemical status. If exceedances of TVs or quality standards are recorded the following relevant tests are carried out:

- General assessment of the chemical status: Data aggregation is performed and it is checked whether the total area of exceedance is greater than 20% of the total area of the GWB. In case there are no exceedances, the test indicate a good status for the water body.
- Saline or other intrusion: not relevant.
- Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: the location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters; a comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test show a good status for the water body if these criteria are achieved.
- Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test show a good status for the water body if this criteria is achieved;
- Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality.

To assess the chemical status of the groundwater bodies, the following steps are considered.

- for each monitoring point the annual average concentrations for each indicator was calculated; for the metals the concentration of the dissolved form was considered;
- For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).
- The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point.
- The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface.

The chemical status of the GWB RODL06 is poor, considering the results of applying the methodology for chemical status assessment

	<p>Quantitative Status</p> <p>Bulgaria: The assessment considered data from national and self-monitoring of groundwater abstraction facilities according to the issued permits. The main criteria for assessing good quantitative status are the exploitable (available) groundwater resources of GWB and the groundwater level. To verify compliance with the requirements of the WFD, various tests were performed. The assessment was based on data from 2017–2020 and trends were assessed, with data from 2007–2020. The following tests were performed:</p> <ul style="list-style-type: none"> - Water balance test: the assessment of the GW level downward trend is an indication that, the available GW resources were exceeded and the GWB is in poor status. - Surface water test and terrestrial ecosystem test: both not applicable in BG-2 as surface water bodies and terrestrial ecosystems are not associated/connected. - Saline intrusion test: not relevant <p>Romania: The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account the CIS Guidance no.18. The following criteria have been used:</p> <ul style="list-style-type: none"> • water balance • the connection with surface waters • the influence on the terrestrial ecosystems which depend directly on the GWB • the effects of saline or other intrusions <p>The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average levels during the whole observation period.</p>
Groundwater threshold value relationships	<p>Receptors considered:</p> <p>Romania: Drinking Water standards Bulgaria: Drinking Water standards</p> <p>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</p> <p>Romania: The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting. As described above, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where NBL are smaller than MAC. Where NBL are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB ($TV = NBL + 0.2 NBL = 1.2 NBL$).</p> <p>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for GWBs from Romania.</p> <p>Bulgaria: The methodology for TV determination in Bulgaria has been developed according to CIS Guidance No. 18. TVs are determined by comparing NBLs with criterial values (CVs). CVs is the concentration of a pollutant (without taking into account the NBLs), which, if exceeded, could lead to a distortion of the criteria for good status. CVs should take into account the risk assessment and receptors of groundwater.</p> <p>The NBL were established for each GWB as a result of the project report 'Assessment of the natural hydrochemical background of the substances composition of groundwater in Bulgaria' (GEOFUND V-402), 1998' NBLs are available for Ca, Mg, SO₄, Cl, HC0₃, Total hardness, Cu, Pb, Zn, As, Fe, F, Al, Mn, Cr, Co, V, J, Ag, Ni, Na, K.</p> <p>The NBLs were determined for each hydrogeological classes (5 classes) in the 90th percentile and 50th percentile (median) of the statistical sample.</p> <p>Criterial values (CVs) have been drinking water standards according to the Bulgarian Regulation N-9.</p> <p>When $NBL > CV$, the TV is equal to NBL.</p> <p>When $CV > NBL$, the $TV = NBL + K_{tv} * (CV - NBL)$. $0 < K_{tv} < 1$</p> <p>K_{tv} is usually between 0.5 and 0.75, as recommended and providing reasonable assurance. $K_{tv} < 0.5$ has a large certainty and is used for GWBs, which have important economic significance and are the sole source of drinking water supply of settlements. This value should be used for such GWB to which they are attached particularly valuable wetlands presence of</p>

	<p><i>dependent PA terrestrial ecosystems. The higher value (0.75) is used in all other cases or GWBs already classified bodies at risk.</i></p>
<p>Verbal description of the trend assessment methodology</p>	<p>Bulgaria: <i>The trend analysis is based on recognized statistical methods such as regression method and a time series of data from 2012 to 2019 (using annual values, semi-annual or quarterly values).</i></p> <p><i>Based on regression analysis is assessed whether there is a break in the trend i.e. after sustained upward trend follows sustained downward trend or the opposite case the sustained downward trend is followed by sustained upward trend.</i></p> <ul style="list-style-type: none"> • <i>Initially, the entire curve of the experimental data is approximated by a polynomial curve of degree 2 (quadratic regression curve).</i> • <i>If there is detected a maximum in the polynomial curve it means that a change of the direction of the trend is available - from ascending to descending.</i> • <i>If there is detected a minimum in the polynomial curve it means that a change of the direction of the trend is available - from descending to ascending.</i> • <i>Then, (in case of available maximum) the entire curve is divided into two branches : 1st branch – till the date of the maximum and the second branch - after the peak.</i> • <i>In case with available minimum: 1st branch – till the date of the minimum and the second branch - after the minimum.</i> • <i>Data from the first and second branch are considered separately and are approximated by linear trends (straight lines). The date at which it crossed the two approximating straight lines corresponds to the date at which it changes the direction of the linear trend - from ascending to descending or from descending to ascending</i> <p><i>By extrapolation of the second (falling) trend can be predicted date at which the starting concentration (75% GWQS in our case 60% TV) will be reached</i></p> <p>Romania: <i>In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 17 years (2000–2017).</i></p> <p><i>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program.</i></p> <p><i>The steps used for trend assessment were:</i></p> <ul style="list-style-type: none"> • <i>Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2017)</i> • <i>Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000</i> • <i>Calculation of annual average for the available data in each monitoring point</i> • <i>Significant upward trends were identified by Gwstat software, based on Anova Test</i>
<p>Verbal description of the trend reversal assessment methodology</p>	<p>Bulgaria: <i>The starting point for trend reversal should be placed where the concentration of the pollutant reaches 75% of the groundwater quality standard or 75% of the threshold value of the relevant pollutant. Selected starting points should be possible to reverse trends in the most effective way before pollutant concentrations can cause irreversible changes in groundwater quality. When we have GWB who responds too slowly to changes, there may be a need for an early starting point and vice versa - for responsive GWB should be chosen starting point at a later moment.</i></p> <p><i>Initially, the entire curve of the experimental data is approximated by a polynomial curve of degree 2 (quadratic regression curve).</i></p> <ul style="list-style-type: none"> • <i>If there is detected a maximum in the polynomial curve it means that a change of the direction of the trend is available - from ascending to descending.</i> • <i>If there is detected a minimum in the polynomial curve it means that a change of the direction of the trend is available - from descending to ascending.</i> • <i>Then, (in case of available maximum) the entire curve is divided into two branches: 1st branch – till the date of the maximum and the second branch - after the peak</i> <p><i>In case with available minimum: 1st branch – till the date of the minimum and the second branch - after the minimum.</i></p>

<p>Data from the first and second branch are considered separately and are approximated by linear trends (straight lines). The date at which it crossed the two approximating straight lines corresponds to the date at which it changes the direction of the linear trend - from ascending to descending or from descending to ascending</p> <p>By extrapolation of the second (falling) trend can be predicted date at which the starting concentration (75% GWQS in our case 60% TV) will be reached .Practically for the second RBMP we have used 60 % from the TV.</p> <p>Romania: Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</p> <ul style="list-style-type: none"> • optimizing the choice of time sections regarding the shape of the resulting model; • examining the significance of the rift for the simple linear regression model based on the square of the residue sum; • conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model.

GWB-5: Mures / Maros

GWB-5	National share	HU-5 RO-5	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	HU	HU_AIQ605	Poor (NH ₄ , NO ₃ , SO ₄ , Cl)	Good
	HU	HU_AIQ604	Good	Good
	HU	HU_AIQ594	Poor (NH ₄ , NO ₃ , SO ₄)	Poor
	HU	HU_AIQ593	Good	Good
	RO	ROMU20	Poor (nitrates)	Good
	RO	ROMU22	Good	Good
Description/C haracterisation of the ICPDR GW-body	<p><i>The alluvial deposit of the Maros/Mures River lies along both sides of the southern Hungarian – Romanian border, to the north of the actual river bed of the Maros/Mures. In particular, it is an important water resource for drinking water purposes for both countries and water abstraction in one country influences the water availability in the other.</i></p> <p><i>The basin of the SE part of the Great Hungarian Plain is filled up with more than 2000 m thick deposits of different ages, which are progressively thinning in Romania. The alluvial fan of the Maros/Mures River forms the Pleistocene part of the strata. The aquifer is divided into several GWBs in both countries. Despite the differences in the delineation method of the two countries, it was possible to select the relevant water bodies from the transboundary point of view. Of the four water bodies containing cold water in Hungary (HU), two contain Quaternary strata from the surface to a depth of 30 m, namely the shallow GWBs (HU_AIQ605, HU_AIQ594). Underneath them are two porous GWBs (GWB HU_AIQ604, HU_AIQ593), which, besides Quaternary strata, include some parts of the Upper- Pannonian deposits as well (to a depth of 400–500 m corresponding to the surface separating cold and thermal waters).</i></p> <p><i>Two Quaternary water bodies have been selected in Romania.</i></p> <p><i>On the Romanian side, two water bodies are included in the transboundary evaluation because in the Romanian method there is a separating horizon at the limit of the Upper (GWB ROMU20) and Lower Pleistocene (GWB ROMU22) age of the strata. Both water bodies can be lithologically characterised by pebbles, sands and clayey inter-layers, but the upper part is significantly coarser with better permeability. Virtually following the same separation line on the Hungarian side, the lower 100 m of the 250–300 m thick Pleistocene strata is silty-sand, sandy-silt, sand and clay, and the upper part is mainly sand with gravel, so that permeability improves towards the surface (the hydraulic conductivity of the aquifers ranges between 5–30 m/day). The covering layer is mainly sandy silt and clay of 3-13 m thickness.</i></p> <p><i>On the Romanian side, the upper water body is unconfined and the lower is confined.</i></p> <p><i>In Hungary both confined and unconfined conditions occur in the southern water bodies (HU_AIQ604, HU_AIQ605) and mainly confined conditions are characteristic for the water bodies of the upward flow system (HU_AIQ593, HU_AIQ594). The groundwater table is 2–4 m below the surface in Hungary. Recharge in sandy areas has only local importance (15 Mm³/year). At present, because of the considerable amount of water abstracted from the deep layers, there is a permanent recharge from shallow groundwater to the deep groundwater system (app. 15 Mm³/year) and large areas with sandy-silty covered layers also contribute to the recharge of the abstracted amount in Hungary. Another important element of the global recharge of the Hungarian part is the lateral flow across the border, estimated at 15–20 Mm³/d</i></p>			

	<i>(uncertain value based on limited available knowledge). The direction of the groundwater flow is from the recharge area to the discharge areas (main river valleys and zones with groundwater level close to the surface) i.e. from SE to N and NW</i>
Description of status assessment methodology.	<p><u>Chemical status</u></p> <p>Romania: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p><i>The first step is to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs are recorded, the groundwater body is considered as being in good chemical status. If exceedances of TVs or quality standards are recorded the following relevant tests are carried out:</i></p> <ul style="list-style-type: none"> • <i>General assessment of the chemical status: Data aggregation is performed and it is checked whether the total area of exceedance is greater than 20% of the total area of the GWB. In case there are no exceedances, the test indicate a good status for the water body.</i> • <i>Saline or other intrusion: not relevant.</i> • <i>Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: the location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters; a comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test show a good status for the water body if these criteria are achieved.</i> • <i>Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test show a good status for the water body if this criteria is achieved;</i> • <i>Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality.</i> <p><i>To assess the chemical status of the groundwater bodies, the following steps are considered:</i></p> <ul style="list-style-type: none"> • <i>For each monitoring point the annual average concentrations for each indicator was calculated; for the metals the concentration of the dissolved form was considered;</i> • <i>For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).</i> • <i>The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point.</i> • <i>The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface.</i> <p><i>The chemical status of the GWB ROMU20 is poor, considering the results of applying the methodology for chemical status assessment.</i></p> <p>Hungary: <i>Assessment of the chemical status of GWBs was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The NBLs were calculated and used to determine TVs. TVs have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC.</i></p> <p><i>The following parameters were investigated:</i></p> <ol style="list-style-type: none"> a) <i>NBL was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate</i> b) <i>For each monitoring point the median concentration of each parameters of the studied period was compared to the TVs (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides).</i> c) <i>Different tests were conducted to assess GWB status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these</i>

	<p>tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen.</p> <p>d) Based on these tests, GWB was evaluated.</p> <p>Quantitative Status</p> <p>Romania: The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> • water balance • the connection with surface waters • the influence on the terrestrial ecosystems which depend directly on the GWB • the effects of saline or other intrusions <p>The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average levels during the whole observation period.</p> <p>Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> • <u>GW alteration (Drawdown) test</u> • Water Balance test • Surface Water Flow test • Groundwater Dependent Terrestrial Ecosystems (GWDTE) • Saline or other Intrusion test
Groundwater threshold value relationships	<p>Receptors considered</p> <p>Romania: Drinking Water standards</p> <p>Hungary: Drinking water</p> <p>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</p> <p>Romania: The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting.</p> <p>As described previously, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where NBL are smaller than MAC. Where background levels are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB ($TV = NBL + 0.2 NBL = 1.2 NBL$).</p> <p>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for groundwater bodies from Romania.</p> <p>Hungary:</p> <p>EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</p> <p>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO₄ and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</p>
Verbal description of the trend	<p>Romania: In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 17 years (2000-2017).</p>

assessment methodology	<p>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2017) Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000 Calculation of annual average for the available data in each monitoring point Significant upward trends were identified by Gwstat software, based on Anova Test <p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Man-Kendall method with fitted Sen slope. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points. The trend of groundwater body level aggregates of yearly annual data were assessed as well. Significant upward or downward trends were identified on 95 and 90% significance level using Man-Kendall method with Sen's slope. 				
Verbal description of the trend reversal assessment methodology	<p>Romania: Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</p> <ul style="list-style-type: none"> optimizing the choice of time sections regarding the shape of the resulting model; examining the significance of the rift for the simple linear regression model based on the square of the residue sum; conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model.. <p>Hungary: To assess the trend reversal of pollutant concentrations, two consecutive time periods were compared and evaluated</p>

Description/C characterisation of the ICPDR GW-body	<p>Reasons for selection as an important transboundary GWB</p> <p><i>The alluvial deposit of the Somes/Szamos River extends on both sides of the northern part of the Hungarian-Romanian border. It is also connected to the aquifer system lying in Ukraine close to the borders. The aquifer system supplies drinking water to a population of approx. 170,000 inhabitants in Romania and 50,000 inhabitants in Hungary. On the Hungarian side, due to the lowland character and upward flow system, the terrestrial ecosystems require surplus transpiration from groundwater; 7% of the area of the water body is under nature conservation. The recharge zone is in Romania and Ukraine, thus the available groundwater resource and the status of the terrestrial ecosystems on the Hungarian side depend on the lateral flow from the neighbouring countries. The Romanian and Hungarian parts of the water body complex are described below.</i></p> <p>General description</p> <p><i>The Somes/Szamos River has formed a 30–250 m thick alluvial deposit</i></p> <p><i>The aquifer is divided into several GWBs in both countries. Despite the differences in the delineation method of the two countries, it was possible to select the relevant water bodies from the transboundary point of view.</i></p> <p><i>Four water bodies containing cold water occur in Hungary. Two of them contain Quaternary strata from the surface to a depth of 30 m, namely the shallow GWBs (HU_AIQ649, HU_AIQ600). Underneath are the porous GWBs (HU_AIQ648, HU_AIQ601), which beside Quaternary strata include some parts of the Upper- Pannonian deposits as well, to a depth of 400–500 m corresponding to the surface separating cold and thermal waters.</i></p> <p><i>This Holocene-Pleistocene formation is divided vertically in Romania by the horizon separating the Upper- and Lower-Pleistocene strata. In Romania two water bodies are considered, overlapping each other, covering a surface of 1,440 km². According to the Hungarian approach of delineation, the cold part of the Upper-Pannonian and the Pleistocene and Holocene layers are vertically unified. The Hungarian part can be characterised only by an upward flow system, thus no further horizontal separation is applied. The area covered by the water body is 1,035 km².</i></p>			

	<p><i>In Romania, the shallow (Holocene-Upper-Pleistocene) aquifer is unconfined, consisting of sands, argillaceous sands, gravels and even boulders in the eastern part, and has a depth of 25–35 m. The silty-clayey covering layer is 5–15 m thick.</i></p> <p><i>The deeper (Lower-Pleistocene) aquifer is confined (it is separated from the Upper-Pleistocene part by a clay layer); its bottom is declining from 30 m to 130 m below the surface from East to West. The gravelly and sandy strata (characteristic to westwards from Satu-Mare town) represent the main aquifer for water supply in the region.</i></p> <p><i>In Hungary (as part of the cold water body), the Quaternary (Pleistocene) and Holocene strata are 50 m thick at the Ukrainian border and its continuously declining bottom is around 200 m below the surface at the western boundary. Mainly confined conditions characterise the Hungarian part, with a silty clayey covering layer of 1–6 m (increasing from the NE to the SW). The Quaternary aquifer is sand or gravelly sand, and the hydraulic conductivity ranges between 10–30 m/d. It should be noted that the Hungarian water body includes the cold water bearing part of the Upper-Pannonian formation as well, to a depth of 400–500 m (under this level, thermal water of a temperature greater than 30 °C can be found).</i></p> <p><i>Depth of the groundwater level (mainly pressure in confined area) below the surface ranges between 2 and 5 m in Hungary. The flow direction is from the ENE to the WSW in both countries, corresponding to the recharge and main discharge zones (rivers and area with groundwater level close to the surface).</i></p> <p><i>The recharge area is in the Romanian part of the water body (and in Ukraine). In Hungary the infiltrated amount from local recharge zones supplies neighbouring discharge zones and cannot be considered as part of the available groundwater resources.</i></p>
Description of status assessment methodology.	<p><u>Chemical status</u></p> <p>Romania: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p><i>The first step is to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs are recorded, the groundwater body is considered as being in good chemical status. If exceedances of TVs or quality standards are recorded the following relevant tests are carried out:</i></p> <ul style="list-style-type: none"> • <i>General assessment of the chemical status: Data aggregation is performed and it is checked whether the total area of exceedance is greater than 20% of the total area of the GWB. In case there are no exceedances, the test indicate a good status for the water body.</i> • <i>Saline or other intrusion: not relevant.</i> • <i>Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: the location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters; a comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test show a good status for the water body if these criteria are achieved.</i> • <i>Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test show a good status for the water body if this criteria is achieved;</i> • <i>Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality.</i> <p><i>To assess the chemical status of the groundwater bodies, the following steps are considered:</i></p> <ul style="list-style-type: none"> • <i>For each monitoring point the annual average concentrations for each indicator was calculated; for the metals the concentration of the dissolved form was considered;</i> • <i>For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).</i> • <i>The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point.</i>

	<ul style="list-style-type: none"> • <i>The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface.</i> <p>Hungary: <i>Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC. The following parameters were investigated:</i></p> <ol style="list-style-type: none"> a) <i>Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate</i> b) <i>For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides).</i> c) <i>Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen.</i> d) <i>Based on these tests, groundwater body was evaluated.</i> <p><u>Quantitative Status</u></p> <p>Romania: <i>The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account the CIS Guidance No.18. The following criteria have been used:</i></p> <ul style="list-style-type: none"> • <i>water balance</i> • <i>the connection with surface waters</i> • <i>the influence on the terrestrial ecosystems which depend directly on the GWB</i> • <i>the effects of saline or other intrusions</i> <p><i>The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average levels during the observation period.</i></p> <p>Hungary: <i>To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</i></p> <ul style="list-style-type: none"> • <u><i>GW alteration (Drawdown) test</i></u> • <i>Water Balance test</i> • <i>Surface Water Flow test</i> • <i>Groundwater Dependent Terrestrial Ecosystems (GWDTE)</i> • <i>Saline or other Intrusion test</i>
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Romania: <i>Drinking Water standards</i></p> <p>Hungary: <i>Drinking water</i></p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</u></p> <p>Romania: <i>The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting.</i></p>

	<p>As described previously, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where natural background levels (NBL) are smaller than MAC. Where background levels are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB ($TV = NBL + 0.2 NBL = 1.2 NBL$).</p> <p>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for groundwater bodies from Romania.</p> <p>Hungary:</p> <p>EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</p> <p>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO₄ and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</p>
Verbal description of the trend assessment methodology	<p>Romania: In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 10 years (2000-2011).</p> <p>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program.</p> <p>The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2011) • Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000 • Calculation of annual average for the available data in each monitoring point • Significant upward trends were identified by Gwstat software, based on Anova Test <p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Man-Kendall method with fitted Sen slope. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points. • The trend of groundwater body level aggregates of yearly annual data were assessed as well. • Significant upward or downward trends were identified on 95 and 90% significance level using Man-Kendall method with Sen's slope.
Verbal description of the trend reversal assessment methodology	<p>Romania: Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</p> <ul style="list-style-type: none"> • optimizing the choice of time sections regarding the shape of the resulting model; • examining the significance of the rift for the simple linear regression model based on the square of the residue sum; • conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model. <p>Hungary: To assess the trend reversal of pollutant concentrations two consecutive time period was compared and evaluated</p>

Description/C haracterisation of the ICPDR GW-body	<p><i>The GWB is mainly used for drinking water supply, agricultural and industrial supplies. The criterion for selection as “important” consists in its size that exceeds 4,000 km².</i></p> <p><i>The whole aquifer system of the Danube-Tisza region stretches from the foothills of the northern mountainous region of Hungary to the Danube in Serbia, where the river flows to the south-east. The western boundary is the Danube itself downstream of Budapest in Hungary but after crossing the Hungarian border it enlarges towards Slavonia (western part of Backa in Croatia). The eastern boundary is somewhat east from the Tisza River in Hungary and in Serbia it includes the Banat as well, whose eastern part is in Romania. The Danube, Tisza and Timis Rivers are important discharge-lines but cannot be considered as pure hydrodynamic boundaries, since there is some flow under the river in the deeper aquifer that is not discharged into the river.</i></p> <p><i>The porous aquifer system between the Danube and Tisza Rivers is the biggest geological unit of the Pannonian Basin. It lies mainly in Hungary and Serbia, with a smaller part in Croatia and Romania. Serbia and Hungary have selected it as an important transboundary GWB complex because: (i) size, (ii) importance in supplying drinking water for the population and (iii) the need to satisfy the water demand of agriculture and industry, (iv) protected areas cover a large part of the GWB complex (protection zones for vulnerable drinking water resources, nature conservation areas and nitrate-sensitive areas).</i></p> <p><i>In Serbia, the area of the whole Dunav aquifer system is 17,435 km² (the areas of Backa and Banat). However, the transboundary importance is related only to the GWBs adjacent to the state borders with Hungary (a total of 6 GWBs: 3 shallow (RS_TIS_GW_SI_1; RS_TIS_GW_SI_2; RS_TIS_GW_SI_3) and 3 deep (RS_TIS_GW_I_1; RS_TIS_GW_I_2; RS_TIS_GW_I_3)) and with Romania (a total of 6 GWBs: 3 shallow (RS_TIS_GW_SI_4; RS_TIS_GW_SI_7; RS_D_GW_SI_1) and 3 deep (RS_TIS_GW_I_4; RS_TIS_GW_I_7; RS_D_GW_I_1). The area of water bodies situated towards Hungary is 5,647 km² and towards Romania 4,859 km², with a total aggregated area of 10,506 km² for the Vojvodina GWB.</i></p> <p><i>In Hungary, the aquifer system is divided into several water bodies according to major subsurface catchment areas and downward-upward flow systems. For the transboundary conciliation, only the southern part of the aquifer system is considered, which includes 10 cold water bodies. Five of them contain Quaternary strata from the surface to a depth of 23–30 m.</i></p>			

	<p><i>Beneath these are five porous GWBs. Besides Quaternary strata, these include part of the Upper-Pannonian deposits as well, to a depth of 400–500 m corresponding to the surface and separating cold and thermal water bodies. The Hungarian part can be characterised by both upward and downward flow systems that are the basis for the horizontal separation of the GWBs. The area covered by these water bodies is 7,098 km². The aquifer can be considered unconfined in the shallow GWBs, despite a considerable area where the water level is in the semi-permeable covering layer, and confined in the deeper ones.</i></p> <p><i>The depth of the groundwater level below the surface ranges between 3 and 5 m in Hungary, with a maximum depth of 7–12 m in the main recharge zones (HU_AIQ529, HU_AIQ591 and HU_AIQ533).</i></p> <p><i>In Romania, the aquifer system covers around 11,408 km² and is adjacent to the state border with Serbia. The GWB is generally confined, its covering strata being of Quaternary age. The depth of the groundwater level below surface ranges from 3–20 m. The protection degree of the GWB is very good. The main aquifer is the Quaternary alluvial deposit of the Danube lying on the Pannonian strata. Its thickness is a few tens of meters at the northern, western and southern boundary and increases up to 700 m in the middle of the basin (in the lower Tisza-valley). At the eastern boundary, the thick Quaternary deposit is a mixture of the alluvial deposits of the Danube and the Carpathian rivers. In respect to lithology, the aquifer consists of medium and coarse sands and gravely sands with inter-layers and lenses of silty sands and silty clays. Average hydraulic conductivity ranges between 5–30 m/d. The topographically elevated ridge between the Danube and the Tisza is formed of eolian sand with relatively good recharge conditions and phreatic groundwater. In the river valleys and east of the Tisza, mainly confined conditions appear. The depth of the fluvial-swamp silty clays and swamp clays overlying strata varies from 10-20 m in the western and southern part, and up to 100–125 m in the north-eastern part of Backa and in Banat. Here, prior to intensive groundwater abstraction, an artesian type of groundwater occurred.</i></p> <p><i>The main recharge area is in Hungary, in the eolian sand ridge, and in Romania. In Hungary, the estimated value of the recharge is approx. 220 Mm³/year. In Serbia, only local recharge areas exist (areas of the Deliblat Sands and the Subotica/Horgos Sands), thus the lateral flow crossing the border from the neighbouring country - as a component of the overall recharge - is very important.</i></p> <p><i>The groundwater is mainly discharged by the rivers (and drainage canals) and by the surplus of evapotranspiration from vegetation in the areas characterised by groundwater levels close to the surface. Small lakes and marshes in locally deeper areas (i.e. in topographic depressions) must be considered as local discharge areas – they are important from the nature conservation point of view. Besides natural discharge, there is also significant groundwater tapping for various uses (drinking water, agriculture, industry, irrigation etc.). In Vojvodina, the entire public water supply relies exclusively on groundwater from aquifers formed at different depths, from 20 m to more than 200 m.</i></p> <p><i>The direction of the groundwater flow in the upper part of the aquifer-system follows the topography and recharge-discharge conditions. At the Hungarian-Serbian border, the flow direction is almost parallel to the border (flowing slightly from Hungary towards Serbia). In the deeper part, the general flow direction is NW to SE i.e. from the Danube to the Tisza in Hungary and in Backa, while in Banat the general direction of the groundwater flow is from E to W. GWB is mainly used for drinking water supply, agricultural and industrial supplies. The criterion for selection as “important” consists in its size that exceeds 4000 km².</i></p>
Description of status assessment methodology.	<p><u>Chemical status</u></p> <p>Romania: <i>The methodology for the chemical status assessment followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 – Guidance on Groundwater status and trend assessment.</i></p> <p><i>The first step is to check any exceedances of the quality standards and TVs which were established taken into consideration the NBL values. If no exceedances of the quality standards and TVs are recorded, the groundwater body is considered as being in good chemical status. If exceedances of TVs or quality standards are recorded the following relevant tests are carried out:</i></p> <ul style="list-style-type: none"> • <i>General assessment of the chemical status: Data aggregation is performed and it is checked whether the total area of exceedance is greater than 20% of the total area of</i>

	<p><i>the GWB. In case there are no exceedances, the test indicate a good status for the water body.</i></p> <ul style="list-style-type: none"> • <i>Saline or other intrusion: not relevant.</i> • <i>Significant diminution of associated surface water chemistry and ecology due to transfer of pollutants from the GWB: the location of the exceedance of the relevant TVs was not found in areas where pollutants might be transferred to surface waters; a comparison of the pollutant load transferred from the GWB to the surface water body with the total load in the surface water body did not exceed 50%. The test show a good status for the water body if these criteria are achieved.</i> • <i>Significant damage to GWDTEs due to transfer of pollutants from the GWB: No GWDTE was found to be damaged. The test show a good status for the water body if this criteria is achieved;</i> • <i>Meets the requirements of WFD Article 7(3) – Drinking Water Protected Areas: there is no evidence of increased treatment due to changes in water quality.</i> <p><i>To assess the chemical status of the groundwater bodies, the following steps are considered:</i></p> <ul style="list-style-type: none"> • <i>For each monitoring point the annual average concentrations for each indicator was calculated; for the metals the concentration of the dissolved form was considered;</i> • <i>For each monitoring point the annual average concentration of the each parameters was compared with the thresholds values (determined for each GWB) or standards value (nitrates and pesticides).</i> • <i>The GWB is of good chemical status when no EQS or TV is exceeded in any monitoring point.</i> • <i>The GWB is of poor chemical status when EQS or TV are exceeded at monitoring points representing more than 20% of the GWB surface..</i> <p><i>Hungary:</i> <i>Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC.</i></p> <p><i>The following parameters were investigated:</i></p> <ol style="list-style-type: none"> <i>a) Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate</i> <i>b) For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides).</i> <i>c) Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen.</i> <i>d) Based on these tests, groundwater body was evaluated.</i> <p><i>Serbia:</i> <i>The criteria for the chemical status assessment were: present groundwater quality, pressures and their impacts, natural protection (overlying strata),. Pressures and impacts where assessed on the basis of the census data at settlement level for the 2011 regarding demographics, sanitation and water supply practices (septic tanks, sewerage, water supply, connection rates) and agricultural census data from 2012 (livestock, Agricultural land use). The Census data was projected to 2016 for the purpose of STATUS assessment. Non agricultural land use pressures were evaluated on the basis of CORINE 2016 data set and CORINE CLASS specific pollution coefficients for BOD, TN. Pressures were evaluated for organic pollution and nutrients (Indicators used were BOD, TN). Pressure analysis were conducted for 160 analytical units (settlements covering the total area of ground water bodies).</i></p>
--	---

Monitoring data for 16 groundwater monitoring stations for the 12 GWB in Serbia covering a period from 2004 to 2018 was evaluated and stations with at least 5 years of data on monitoring were selected for status and impact assessment. Parameters considered for the analysis included NO₃ and pesticides. For each of the monitoring stations trend analysis were conducted on all available data (minimum for 5 years, maximum for 15 years). Trend significance was classified in terms of annual rate of increase/decrease in a manner that would lead to the exceedance of the threshold value for NO₃ (50 mg/L as NO₃) within 10 years in relation to the observed average NO₃ concentration at any given station. Regression coefficient values were used as a measure of a level of confidence of the trend assessment so that if r² value was above 0,7 trend assessment was to be considered as high confidence assessment, values of r² between 0,4 and 0,7 lead to medium confidence of the trend assessment and values of r² indicate that trend assessment is of low confidence.

- The GWB is of good chemical status when no TV is exceeded in any monitoring point and when no significant increasing trend is detected, and GW is not under significant pressure (Pressure is considered to be significant if total load on the GWB exceeds 10 kg TN-N/ha/yr)
- The GWB is of poor chemical status when TV are exceeded at monitoring points representing more than 20% of the GW samples analysed at the particular monitoring point in the period from 2004 to 2018.
- The GWB is declared under risk if observed trend would lead to the exceedance of the TV for NO₃ within 10 if the observed trend continued at any of the monitoring stations for a given water body. The assessment of Risk is accompanied with level of confidence of the assessment.

Quantitative Status

Romania: The criterion for risk assessment of the quantity status is based on trend assessment evolution of the groundwater levels. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:

- water balance
- the connection with surface waters
- the influence on the terrestrial ecosystems which depend directly on the GWB
- the effects of saline or other intrusions

The quantitative status analysis has been done for the GWB level by comparing the average of the hydrostatic level from 2017 (reference year) with the multiannual average levels during the observation period.

Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:

- GW alteration (Drawdown) test
- Water Balance test
- Surface Water Flow test
- Groundwater Dependent Terrestrial Ecosystems (GWDTE)
- Saline or other Intrusion test

Serbia: Considering the risk of not achieving good quantitative status, groundwater bodies within which there is a registered trend of groundwater level decrease as a consequence of abstraction are considered to be at risk. For this purpose, data time series of registered groundwater levels were used only for shallow GWBs, since no organized monitoring of deep aquifers exists.

For groundwater bodies where no quantitative monitoring exists, the estimate of groundwater balance is calculated, using available data on precipitation, abstraction etc. Assessment of risk from non-achievement of the good quantitative status until 2015 was carried out based on the criteria that average GW abstraction over several years < 50% of groundwater recharge, no substance intrusion into the body caused by the change of GW streaming direction and associated surface ecosystems are not endangered by GW abstraction.

Groundwater threshold value relationships	<p><u>Receptors considered:</u></p> <p>Romania: <i>Drinking Water standards</i></p> <p>Hungary: <i>Drinking water</i></p> <p>Serbia:</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</u></p> <p>Romania: <i>The methodology for TV establishment in Romania has been developed according to CIS Guidance No. 18. NBL are the key elements in the process of TV setting.</i></p> <p><i>As described previously, during the TV establishment, the NBL have been compared with the drinking water standards. The maximum allowable concentrations (MAC) provided by the Law no.458/2002 as amended, were chosen as TV where natural background levels (NBL) are smaller than MAC. Where background levels are higher than MAC, a small addition of 0.2 NBL was used, in order to avoid misclassification of the respective GWB (TV = NBL + 0.2 NBL = 1.2 NBL).</i></p> <p><i>The updated list of TVs established for each GWB was published in the new Order of the Minister no. 621/2014 approving TV for groundwater bodies from Romania.</i></p> <p>Hungary: <i>EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</i></p> <p><i>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</i></p> <p><i>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO4 and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</i></p> <p>Serbia:</p>
Verbal description of the trend assessment methodology	<p>Romania: <i>In order to assess the trend in pollutant concentrations, the results of the chemical analysis from the monitoring points have been used. Minimum period of analysis was at least 17 years (2000-2017).</i></p> <p><i>The methodology for identifying significant upper trends consists in adjustment and aggregation of the data from each monitoring points on groundwater bodies. The trend analysis was done using the Gwstat program. The steps used for trend assessment were:</i></p> <ul style="list-style-type: none"> • <i>Identifying the monitoring points and the associated results of chemical analysis, assessment of data series, for each year of reference period (2000–2017)</i> • <i>Establishment of baseline concentration for each parameter as the average concentration registered during the year 2000</i> • <i>Calculation of annual average for the available data in each monitoring point</i> • <i>Significant upward trends were identified by Gwstat software, based on Anova Test</i> <p>Hungary: <i>To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Man-Kendall method with fitted Sen slope. The steps used for trend assessment were:</i></p> <ul style="list-style-type: none"> • <i>During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points.</i> • <i>The trend of groundwater body level aggregates of yearly annual data were assessed as well.</i> <p><i>Significant upward or downward trends were identified on 95 and 90% significance level using Man-Kendall method with Sen's slope.</i></p> <p>Serbia: <i>No methodology for trend assessment has been developed.</i></p>
Verbal description of the trend reversal assessment methodology	<p>Romania: <i>Trend reversal assessment methodology consists also in the use of Gwstat software. This method assumes that the time series can be characterized by two linear trends with a slope change within the time interval (analysis period). Thus, by applying the 95% quantile of the distribution, a reversal of the trend is identified, if in the first section the slope of the trend is positive, and in the second section the slope of the trend is negative. The stages of the method of reversing the pollutant concentration tendency:</i></p>

	<ul style="list-style-type: none"> • optimizing the choice of time sections regarding the shape of the resulting model; • examining the significance of the rift for the simple linear regression model based on the square of the residue sum; • conducting a statistical test to verify that the 2-sections model is significantly more than a simple regression model. <p>Hungary: To assess the trend reversal of pollutant concentrations two consecutive time periods were compared and evaluated</p> <p>Serbia: No methodology for trend reversal assessment has been developed</p>

Description/C haracterisation of the ICPDR GW-body	<p>Slovakia: <i>The delineation consists of the following steps:</i></p> <ol style="list-style-type: none"> <i>The aquifers are vertically divided in three floors: Quaternary sediments, Pre-Quaternary strata containing cold waters, thermal aquifers (temperature > 25 °C or it is considered as thermal by classification).</i> <i>The pre-Quaternary strata are further divided horizontally by geological types of the aquifer: volcanic rocks, other fissured rocks, karstic rocks, porous sediments.</i> <i>Further separation is due to the borders of the surface catchment areas considered as river basin management units.</i> <p>Hungary: <i>The delineation of groundwater bodies in Hungary has been carried out by:</i></p> <ol style="list-style-type: none"> <i>Separation of the main geological features: porous aquifers in the basins, karstic aquifers, mixed formations of the mountainous regions, other than karstic aquifers.</i> <i>Thermal water bodies are separated according to the temperature greater than 30 °C. In the case of porous aquifers it is done vertically, while in karstic aquifers horizontally. There are no thermal aquifers in the mountainous regions other than karstic.</i> <i>Further division is related to the subsurface catchment areas and vertical flow system (in the case of porous aquifers) and to the structural and hydrological units (in the case of karstic aquifers and mountainous regions).</i> <p><i>For transboundary water bodies the more detailed further characterisation is carried out (n.b. because of the numerous transboundary water bodies and the expected further 20–30 % due to the risk of failing good status, Hungary decided to apply the methodology of further characterisation for all water bodies).</i></p> <p>Reasons for selecting as important transboundary GWB</p> <p><i>The large alluvial deposit of the River Danube downstream Bratislava lies in three countries: Slovakia (Podunajská lowland and its part: Žitný ostrov), Hungary (Northern part of Kisalföld including the Szigetköz) and in Austria. The aquifer system has been considered by Slovakia and Hungary as an important transboundary aquifer because of (i) its size, (ii) the unique amount of available groundwater resource and the important actual use for drinking water and other purposes as well (iii) the groundwater dependent terrestrial ecosystem of the floodplain, (iv) majority of the area is protected (protection zones of drinking water abstraction sites, nitrate sensitive areas, nature conservation areas), (v) the existence of the Gabčíkovo Hydropower System.</i></p> <p>General description</p> <p><i>The Danube has been playing the decisive role in the formation of the aquifer system. The main aquifer is made up of 15–500 m thick Quaternary alluvia: hydraulically connected mixture of sands, gravels, intercalated with numerous clay and silt lenses. The average hydraulic conductivity is in the range of 100–500 m/day providing extremely high transmissivity, especially in the centre of the basin. Here, the bottom of the underlying Pannonian deposits is at a depth of 3,500 m.</i></p> <p><i>The aquifer is divided into several groundwater bodies in both countries. Despite the differences in the delineation method of the two countries, it was possible to select the relevant water bodies from transboundary point of view: two water bodies containing cold water in Hungary, which beside the Quaternary strata include some part of the Upper-Pannonian deposits as well, to the depth of 400–500 m corresponding to the surface separating cold and thermal waters (1,152 km²) and two Quaternary water bodies in Slovakia (2,186 km²) have been selected, i.e. 3,338 km² in total (see the summary table above).</i></p>			

	<p><i>The aquifer can be considered as unconfined, despite the considerable area where the water level is in the semi-permeable covering layer.</i></p> <p><i>Due to the high transmissivity of the aquifer, the groundwater regime and groundwater quality mainly depend on the surface water. The flow system and the type of covering layer provide surplus recharge condition in the majority of the area, but the main source of groundwater recharge is the Danube. Before the construction of the hydropower system (1992), the riverbed had been the infiltration surface, and the Danube's line had been the hydraulic boundary between the countries as well (in upper parts of Danube stream between Devin and Hrušov, approximately since 1970's, river bed started to drain groundwater). In the actual situation, the artificial recharge system is the main source for the vicinity of the Danube, but a remaining part of the aquifers in the Hungarian territory is recharged by the Čunovo reservoir. Where the reservoir is in the neighbourhood of the main channel (between Rajka and Dunakiliti) considerable transboundary groundwater flow appears under the Danube. The Danube's river bed downstream the reservoir – due to the derived flow and the consequently decreased average water level - drains the neighbouring groundwater, causing considerable drop of groundwater level in the imminent vicinity of the river bed. Both the quantity and the quality of the recharge from the reservoir highly depend on the continuously increasing deposit in the reservoir and the developing physico-chemical processes. Deposits in the reservoir are extracted. Signs of long-term changes of quantity and quality of recharge caused by continuously increasing deposit in the reservoir were not observed in the Slovak part of the aquifer yet.</i></p> <p><i>The depth of the groundwater table varies between 2 and 5 m. The wetting conditions of the covering layer has substantially changed along the Danube and in the lower Szigetköz, where prior to the derivation of the Danube the groundwater has fluctuated in the covering layer and the existing artificial recharge system does not compensate sufficiently the former influence of the Danube. On the Slovak territory, annual artificial flooding of the river system in the high water periods seems to efficiently supply groundwater as well as the soil moisture resources.</i></p>
<p>Description of status assessment methodology.</p>	<p><u>Chemical Status</u></p> <p><i>Slovakia: The methodology for assessing chemical status followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 - Guidance on groundwater status and trend assessment. The assessment of the chemical status of GWB in the conditions of the Slovakia consisted of the following tests:</i></p> <ol style="list-style-type: none"> <i>1. General quality assessment (GQA) test - years 2016-2017.</i> <i>2. Drinking water protected areas (DWPA) test - period 2008-2017.</i> <i>3. Test of significant diminution of associated surface water chemistry and ecology due to transfer of pollutant from the GWB - named as Surface water test - period 2013-2018.</i> <p><i>In the GQA test and the Surface water test, the procedure was based on a comparison of the arithmetic means of the concentration of the individual component with quality standards (QS) or thresholds values (TV) for each monitoring point. If no exceedances of the QS/TV were recorded in all monitoring points, the whole GWB was evaluated in good chemical status. If exceedances of QS/TVs were recorded than the methodologies were as follows:</i></p> <p><i>In the GQA test, the data aggregation to whole GWB was performed. If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.</i></p> <p><i>In the Surface water test, each GWB (with the relevant groundwater monitoring point) associated with the surface water body was assessed individually, taking into account the hydrological criterion, the hydrogeological criterion, the groundwater and surface water concentration profile, dilution (if data available) and that the estimated load of pollutant from groundwater transferred to associated surface water could be more than 50%, the GWB was evaluated in poor chemical status.</i></p> <p><i>In the DWPA test, the procedure was based on trend analysis (Mann-Kendal, linear regression, 10 years) of biological, chemical and radiological parameters of groundwater intended for human consumption before any level of treatment. If there was not a statistically significant and sustained upward trend in any drinking water abstraction points, the GWB was evaluated in good chemical status. If there was any significant and sustained upward trend in any parameter in any of drinking water abstraction point in the GWB, the methodology was as follows: the data aggregation to whole GWB was performed (kriging from 2 years mean). If the calculated</i></p>

	<p><i>total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.</i></p> <p>Hungary: Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC.</p> <p>The following parameters were investigated:</p> <ol style="list-style-type: none"> Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides). Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen. Based on these tests, groundwater body was evaluated. <p><u>Quantitative Status</u></p> <p>Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> <u>GW alteration (Drawdown) test</u> Water Balance test Surface Water Flow test Groundwater Dependent Terrestrial Ecosystems (GWDTE) Saline or other Intrusion test <p>Slovakia: Assessment of groundwater quantitative status consists of 4 tests:</p> <ol style="list-style-type: none"> balance assessment of groundwater bodies for the period 2013-2017 and evaluation of the long-term trend of development of balance levels of groundwater bodies for the period 2004-2018 evaluation of the existence of significant declining trends in the groundwater level and spring yield in groundwater bodies for the period 2007-2016 processed by aggregation of point results of groundwater quantity monitoring in the facilities of the state hydrological network of the SHMI assessment of the impact of groundwater quantity on the status of terrestrial ecosystems dependent on groundwater assessment of the impact of groundwater quantity on surface water.
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Slovakia: Drinking water, Surface water</p> <p>Hungary: Drinking water</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards, surface water standards) in the TV establishment:</u></p>

	<p>Slovakia: The natural background level (NBL) was determined and used to derive the threshold value (TV). The TV were determined for all indicators listed in Part B of Annex II to Directive 2006/118/EC and in Directive 2014/80/EU. The TV for the inorganic substances were derived according to the formula: $TV = (NBL + DWS)/2$. The TV for organic compounds were derived using the formula: $TV = 0.75 * DWS$. These TV were used for GQA and DWPA tests.</p> <p>An updated list of the TV established for each GWB was published in the amended Regulation of the Government of the Slovakia no. 282/2010 Coll.</p> <p>For the Surface water test, the TV were derived as follows: $TV = CV = AF * EQS$ (surface water standard)/DF, where AF (Attenuation factor) and DF (Dilution factor) are equal to 1 (the worst case).</p> <p>For that GWB where the NBL was higher than the TV due to natural hydro-geological reasons, the TV was set up as $TV = NBL$.</p> <p>Hungary: EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</p> <p><u>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO4 and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</u></p>
Verbal description of the trend assessment methodology	<p>Slovakia: Trend is assessed separately for groundwater quality and quantity at which for trends in quantity the procedure applies for all GW quantity monitoring sites. The assessment follows a stepwise procedure. Consisting of the evaluation of the data sets and the monitoring points (no gaps in time series are allowed and data from 2007–2016 were used), consisting of the performance of the non-parametric Mann-Kendall trend test (95% confidence level) and comprising the regression analysis. GWBs with decreasing trends but with no evidence of abstraction are excluded from assessment in the 3rd RBMP. For assessing trends in concentrations of pollutants in groundwater the evaluation period was 2007–2016. The results of surveillance and operational monitoring were applied for the assessment. Monitoring frequency depends on the GWB type. In the analysis the values <LOQ are replaced by $LOQ_{max}/2$. Trend assessment is only performed if the number of values <LOQ is less than 50%. Non-parametric Mann-Kendall test with 5% significance level was applied for trend evaluation. For time series showing a normal distribution, the statistical significance of the trend was also tested by the parametric method (ANOVA) with 5% significance level. Than for all times series with statistically significant upwards trends, the statistically significant upward trend was evaluated and identified if the median of the values measured over the last 2 years was higher than $0.75 * QS/TV$ or the calculated predicted value of the linear trend up to 2026 (regression model calculated by the least squares method or Sen's nonparametric procedure) was higher than QS/TV. The significant sustained upward trends of pollutant concentrations were identified at the level of monitoring points and at the GWB level.</p> <p>The starting point for trend reversal was placed where the concentration of the pollutant reaches 75% of the QS/TV of the relevant pollutant.</p> <p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Man-Kendall method with fitted Sen slope. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points. • The trend of groundwater body level aggregates of yearly annual data were assessed as well. <p>Significant upward or downward trends were identified on 95% significance level using Man-Kendall method with Sen's slope.</p>
Verbal description of the trend	<p>Slovakia: Trend reversal assessment methodology consists in the use of GWstat software. Time series were included in the assessment, on the basis of which significant sustained upward trends at the level of monitoring sites in the previous RBMP were classified. The time series</p>

reversal assessment methodology	<p>entering the evaluation were supplemented by data monitored in previous years so that the evaluation period was 14 years. The evaluation was performed by dynamically dividing the time series into two sections with different lengths and then evaluating the statistical significance of the trends separately for each allocated section. A reversal of the trend was indicated if the following conditions were met at the same time: the statistical significance of the trends evaluated within individual sections is higher than the statistical significance of the trend evaluated on the basis of all data forming the evaluated time series, the section representing the results of monitoring in the older period shows a statistically significant upward trend, which is followed by a statistically significant decreasing trend evaluated on the basis of the results of monitoring in the newer period</p> <p>Hungary: To assess the trend reversal of pollutant concentrations two consecutive time period was compared and evaluated</p>

GWB-9: Bodrog

GWB-9	National share	HU-9 SK-9	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	HU	HU_AIQ495	Good	Good
	HU	HU_AIQ496	Good	Poor
	SK	SK1001500P	Poor (NH ₄ , PO ₄)	Good
Description/C haracterisation of the ICPDR GW-body	<p>Delineation: see GWB-8</p> <p><i>At the common eastern border of Slovakia and Hungary, the alluvial aquifer system corresponding to the Bodrog River catchment area in Slovakia and the Tisza-valley between Záhony and Tokaj (confluence with the Bodrog River) has been selected as important due to (i) its significance in meeting the water demand of the region, (ii) contamination threat of the groundwater in the vicinity of state border between Slovakia and Hungary. Some part of the water aquifer system is in Ukraine.</i></p> <p>General description</p> <p><i>The aquifer is the alluvial deposit of the Bodrog River and its tributaries. The Tisza divides the lowland area in Hungary into Bodrokköz (northern part) and Rétköz (Southern part). Holocene silty-clayey layers cover the surface with peaty areas. The Quaternary aquifer is around 60 m thick in the Slovakian side and its thickness gradually increases in Hungary towards the South (50-200 m). The fluvial sediments (from sandy gravels in the North to sands in the South with intercalated silt and clay lenses) can be characterized by 5 – 30 m/d hydraulic conductivity.</i></p> <p><i>In the Slovakian part only the Quaternary aquifer system is part of the transboundary water body-complex while in Hungary the Upper part of the Pannonian formation is also attached (depth is app. 500 m, corresponding to water temperature less than 30°C).</i></p> <p><i>The main recharge area is in the Slovakian territory. The rain waters infiltrate at the marginal mountains and penetrate into permeable deep aquifers. In the upstream part of the catchment area surface waters also contribute to the recharge. In the Slovakian side the water bodies are mainly unconfined or in some places partly confined. In Hungary both water bodies are in discharge position and the main aquifers can be considered as confined. Here the groundwater level lies close to (between 2 and 4 m below) the surface. Where it is around 2 m below the surface, the groundwater can considerably contribute to the transpiration need of the vegetation, which are adapted to that condition, and consequently they are very sensitive to the status of the groundwater. The surplus of evapotranspiration and the artificial drainage system (canals) collect the upward groundwater flow. From South, the sandy hills of Nyírség contribute to the discharged groundwater as well, but the boundary of the waters of different origin is not exactly known (that is why both discharge areas in Hungary have been attached to the transboundary aquifer). The general direction of the groundwater flow is N-S (NE-SW) to the North of the Tisza River and SE-NW in the Rétköz and uncertain below the Tisza.</i></p> <p><i>The regional hydro-geochemical picture follows the flow system. Close to the river bed sections recharging groundwater, the water quality is almost the same as in surface streams. Generally low TDS, Ca-Mg-HCO₃ type waters occur in the recharge areas, Na-HCO₃ waters dominate in the middle and western part of Rétköz, and mixture of these two types in the western part of Bodrokköz region. At the centre of the Bodrokköz, elevated Cl-content indicates strong upward migration from the deeper zones.</i></p> <p><i>The major water quality problem of natural origin in the Bodrokköz Quaternary aquifer complex is the high iron and manganese content (reducing conditions). In the Rétköz elevated (10–30 µl) arsenic-content occurs.</i></p> <p><i>The estimated amount of available groundwater resources is almost 50 Mm³/year in the Slovakian part, out of that 10–15 Mm³/year should be maintained as lateral flow towards the Hungarian part. It is to be mentioned, that the southern part of the Hungarian discharge area receives water from the southern recharge areas as well, but no local recharge can be considered available for abstraction in the Bodrokköz and Rétköz.</i></p> <p>Major pressures and impacts</p>			

	<p><i>The groundwater is mainly used for drinking water supply, but partially for industrial and agricultural purposes (inc. irrigation) as well. The use ratio is quite low in Slovakia: only 10 %. The development is limited by occurrence of technologically inappropriate substances in water (Mn, Fe) and sometimes also by groundwater pollution from surface waters, industry, agriculture and transport infrastructure (Strážske, Hencovce, Michalovce, Cierna nad Tisou).</i></p> <p><i>In Hungary the available groundwater resources of the two water bodies are quite different. In the northern part, which is in close relation to the Slovakian part, the water demand of the groundwater dependent aquatic and terrestrial ecosystems can be estimated at 5–8 Mm³/d, thus the available groundwater resources is in the range of 5–7 Mm³/year. The abstracted amount of groundwater is 3 Mm³/year, so the ratio is around 50 %, but the majority is concentrated to Ronyva/Roňava river valley. In the southern part, the lateral flow from the recharge zone of Nyírség (app. 30 Mm³/year) provides sufficient water for the minimum water demand of ecosystems (8-12 Mm³/year) and for 8 Mm³/year of abstraction.</i></p> <p><i>In Hungary 10 significant point sources of pollution have been registered. The shallow groundwater has usually high nitrate under the settlements, because of the inappropriate handling of manure and the totally or partially missing sewer systems. The agriculture contributes to the pollution as well, through use of chemicals. The estimated amount of surplus Nitrogen is 15 kgN/ha/year originated from the use of 88 kgN/ha/year fertilizer and 13 kgN/year manure.</i></p> <p><i>The groundwater quality in Slovakia is monitored in 17 sampling sites, groundwater samples are taken from the first aquifer 2 times per year). The Hungarian water quality monitoring is concentrating in the surrounding of waterworks. The quality of the Ronyva/Roňava aquifer close to the waterworks of Sátoraljaújhely shows increasing tendency of Nitrate pollution: the average concentration is around 30 mg/l, and in one production well the Nitrate-concentration exceeds the limit value of 50 mg/l. Information on pollution in arable lands is practically missing in this region.</i></p> <p><i>The high vulnerability of groundwater and the expected future development in water demand requires high level of protection in the Slovakian part of the region mainly oriented to measures focused on industrial pollution sources. In Hungary the protection zones of the waterworks (5 %) need special attention.</i></p>
<p>Description of status assessment methodology.</p>	<p>Chemical Status</p> <p>Slovakia: <i>The methodology for assessing chemical status followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 - Guidance on groundwater status and trend assessment. The assessment of the chemical status of GWB in the conditions of the Slovakia consisted of the following tests:</i></p> <ol style="list-style-type: none"> 1. <i>General quality assessment (GQA) test - years 2016-2017.</i> 2. <i>Drinking water protected areas (DWPA) test - period 2008-2017.</i> 3. <i>Test of significant diminution of associated surface water chemistry and ecology due to transfer of pollutant from the GWB - named as Surface water test - period 2013-2018.</i> <p><i>In the GQA test and the Surface water test, the procedure was based on a comparison of the arithmetic means of the concentration of the individual component with quality standards (QS) or thresholds values (TV) for each monitoring point. If no exceedances of the QS/TV were recorded in all monitoring points, the whole GWB was evaluated in good chemical status. If exceedances of QS/TVs were recorded than the methodologies were as follows:</i></p> <p><i>In the GQA test, data aggregation to whole GWB was performed. If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.</i></p> <p><i>In the Surface water test, each GWB (with the relevant groundwater monitoring point) associated with the surface water body was assessed individually, taking into account the hydrological criterion, the hydrogeological criterion, the groundwater and surface water concentration profile, dilution (if data available) and that the estimated load of pollutant from groundwater transferred to associated surface water could be more than 50%, the GWB was evaluated in poor chemical status.</i></p> <p><i>In the DWPA test, the procedure was based on trend analysis (Mann-Kendal, linear regression, 10 years) of biological, chemical and radiological parameters of groundwater intended for human consumption before any level of treatment. If there was not a statistically significant and</i></p>

	<p>sustained upward trend in any drinking water abstraction points, the GWB was evaluated in good chemical status. If there was any significant and sustained upward trend in any parameter in any of drinking water abstraction point in the GWB, the methodology was as follows: the data aggregation to whole GWB was performed (kriging from 2 years mean). If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status</p> <p>Hungary: Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC. The following parameters were investigated:</p> <ol style="list-style-type: none"> Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides). Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen. Based on these tests, groundwater body was evaluated. <p><u>Quantitative Status</u></p> <p>Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> <u>GW alteration (Drawdown) test</u> Water Balance test Surface Water Flow test Groundwater Dependent Terrestrial Ecosystems (GWDTE) Saline or other Intrusion test <p>Slovakia: Assessment of groundwater quantitative status consists of 4 tests:</p> <ol style="list-style-type: none"> balance assessment of groundwater bodies for the period 2013-2017 and evaluation of the long-term trend of development of balance levels of groundwater bodies for the period 2004-2018 evaluation of the existence of significant declining trends in the groundwater level and spring yield in groundwater bodies for the period 2007-2016 processed by aggregation of point results of groundwater quantity monitoring in the facilities of the state hydrological network of the SHMI assessment of the impact of groundwater quantity on the status of terrestrial ecosystems dependent on groundwater assessment of the impact of groundwater quantity on surface water
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Slovakia: Drinking water, Surface water</p> <p>Hungary: Drinking water</p>

	<p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards, surface water standards) in the TV establishment:</u></p> <p>Slovakia: The natural background level (NBL) was determined and used to derive the threshold value (TV). The TV were determined for all indicators listed in Part B of Annex II to Directive 2006/118/EC and in Directive 2014/80/EU. The TV for the inorganic substances were derived according to the formula: $TV = (NBL + DWS)/2$. The TV for organic compounds were derived using the formula: $TV = 0.75 * DWS$. These TV were used for GQA and DWPA tests.</p> <p>An updated list of the TV established for each GWB was published in the amended Regulation of the Government of the Slovakia no. 282/2010 Coll.</p> <p>For the Surface water test, the TV were derived as follows: $TV = CV = AF * EQS$ (surface water standard)/DF, where AF (Attenuation factor) and DF (Dilution factor) are equal to 1 (the worst case).</p> <p>For that GWB where the NBL was higher than the TV due to natural hydro-geological reasons, the TV was set up as $TV = NBL$.</p> <p>Hungary: EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</p> <p><u>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO4 and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</u></p>
Verbal description of the trend assessment methodology	<p>Slovakia: Trend is assessed separately for groundwater quality and quantity at which for trends in quantity the procedure applies for all GW quantity monitoring sites. The assessment follows a stepwise procedure. Consisting of the evaluation of the data sets and the monitoring points (no gaps in time series are allowed and data from 2007–2016 were used), consisting of the performance of the non-parametric Mann-Kendall trend test (95% confidence level) and comprising the regression analysis. GWBs with decreasing trends but with no evidence of abstraction are excluded from assessment in the 3rd RBMP. For assessing trends in concentrations of pollutants in groundwater the evaluation period was 2007–2016. The results of surveillance and operational monitoring were applied for the assessment. Monitoring frequency depends on the GWB type. In the analysis the values <LOQ are replaced by $LOQ_{max}/2$. Trend assessment is only performed if the number of values <LOQ is less than 50%. Non-parametric Mann-Kendall test with 5% significance level was applied for trend evaluation. For time series showing a normal distribution, the statistical significance of the trend was also tested by the parametric method (ANOVA) with 5% significance level. Than for all times series with statistically significant upwards trends, the statistically significant upward trend was evaluated and identified if the median of the values measured over the last 2 years was higher than $0.75 * QS/TV$ or the calculated predicted value of the linear trend up to 2026 (regression model calculated by the least squares method or Sen's nonparametric procedure) was higher than QS/TV. The significant sustained upward trends of pollutant concentrations were identified at the level of monitoring points and at the GWB level.</p> <p>The starting point for trend reversal was placed where the concentration of the pollutant reaches 75% of the QS/TV of the relevant pollutant.</p> <p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Mann-Kendall method with fitted Sen slope. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points. • The trend of groundwater body level aggregates of yearly annual data were assessed as well. <p>Significant upward or downward trends were identified on 95% significance level using Mann-Kendall method with Sen's slope.</p>

Verbal description of the trend reversal assessment methodology	<p>Slovakia: Trend reversal assessment methodology consists in the use of GWstat software. Time series were included in the assessment, on the basis of which significant sustained upward trends at the level of monitoring sites in the previous RBMP were classified. The time series entering the evaluation were supplemented by data monitored in previous years so that the evaluation period was 14 years. The evaluation was performed by dynamically dividing the time series into two sections with different lengths and then evaluating the statistical significance of the trends separately for each allocated section. A reversal of the trend was indicated if the following conditions were met at the same time: the statistical significance of the trends evaluated within individual sections is higher than the statistical significance of the trend evaluated on the basis of all data forming the evaluated time series, the section representing the results of monitoring in the older period shows a statistically significant upward trend, which is followed by a statistically significant decreasing trend evaluated on the basis of the results of monitoring in the newer period</p> <p>Hungary:</p>

GWB-10: Slovensky kras / Aggtelek-hgs.

GWB-10	National share	HU-10 SK-10	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	HU	HU_AIQ485	Good	Good
	SK	SK200480KF	Good	Good
Description/C haracterisation of the ICPDR GW-body	<p>Delineation: see GWB-8</p> <p><i>The Aggtelek Mountain and the Slovensky kras form a large common karstic aquifer system in the Eastern part of the countries. It is selected for presenting in the Danube-basin report as important transboundary water body: (i) National Park covers the majority of its surface, where the role of the groundwater is presented by springs and stalactite caves, (ii) significant drinking water resource in Slovakia, regionally important in Hungary (iii) vulnerable area requiring protection.</i></p> <p>General description</p> <p><i>The GWB is in a Mesozoic complex with morphologically visible karstic plateau and canyon-like valleys of water courses, separating different units. Hydrogeological units are very different according to the character of permeability, character of groundwater circulation, type of groundwater regime, and also in the resulting yield of groundwater springs. From hydrogeological point of view, the most important tectonic unit in the area is the Silicicum unit, mainly its Middle Triassic and Upper Triassic part. The most important aquifer here is the Middle and Upper Triassic limestone and dolomites with karst-fissure type of permeability. Similarly important hydrogeological units in the Hungarian side are Alsóhegy, Nagyoldal, Hasagistya and Galyaság, which contain the Aggtelek-Domica cave system. Tertiary basins act as a regional impermeable barrier for the groundwater accumulated in Triassic limestone.</i></p> <p><i>Groundwater circulation in these rocks is controlled by extreme heterogeneity of carbonate rocks, following the tectonic development. These tectonically pre-destinated drainage structures show the major influence on the directions of groundwater flow. Majority of groundwater is drained towards big karstic springs. Areas between such tectonic faults are less karstified and also less permeable. If not drained by cave systems or permeable tectonic faults, groundwater usually feeds the Quaternary coverage. Specific hydraulic feature of the karstified carbonate complex with preferred drainage structures is that no continuous groundwater table can be defined within the rock mass. Groundwater in many cases only fills up karstic openings – conduits, sometimes enlarged into the cave systems, while segments between the preferred groundwater routes are unsaturated. On the other hand, groundwater level changes in these zones are sharp and show quick response to the meteorological situation. Typical amplitude of groundwater level change is from 5 to 15 m. In such levels above the erosion base perennial springs occur after an intensive rainfall events or sudden snowmelts. Hidden outflow to the deeper structures within and outside of the area the territory (generally of westward direction under the Tertiary sediments of the Rimavská kotlina Basin) is considered to be quite important from the water management point of view. Groundwater abstraction for various purposes is concentrated at the natural outflows of springs – relatively small portion is abstracted by pumping from boreholes and wells.</i></p> <p>Major pressures and impacts</p> <p><i>The estimated amount of available resources in Slovenský kras is 40.4 Mm³/year, the actual use is 21 % of available resources, mainly for drinking water purposes.</i></p> <p><i>In the Hungarian side only the amount of karstic water is utilized, which flows out naturally from karstic springs in Jósvalő, Szögliget, Komjáti, Égerszög and Aggtelek. There are enough data about karst spring discharge. Observed discharge data are available for a period of nearly 30 years. Because of the National Park no important karstic water abstraction will be planned on the area.</i></p> <p><i>National Parks cover the majority of the area. In addition, in Hungary the total area of the GWB is considered as Nitrate-sensitive. .</i></p>			
Description of status	<u>Chemical Status:</u>			

assessment methodology.	<p>Slovakia: The methodology for assessing chemical status followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 - Guidance on groundwater status and trend assessment. The assessment of the chemical status of GWB in the conditions of the Slovakia consisted of the following tests:</p> <ol style="list-style-type: none"> 1. General quality assessment (GQA) test - years 2016-2017. 2. Drinking water protected areas (DWPA) test - period 2008-2017. 3. Test of significant diminution of associated surface water chemistry and ecology due to transfer of pollutant from the GWB - named as Surface water test - period 2013-2018. <p>In the GQA test and the Surface water test, the procedure was based on a comparison of the arithmetic means of the concentration of the individual component with quality standards (QS) or thresholds values (TV) for each monitoring point. If no exceedances of the QS/TV were recorded in all monitoring points, the whole GWB was evaluated in good chemical status. If exceedances of QS/TVs were recorded than the methodologies were as follows:</p> <p>In the GQA test, data aggregation to whole GWB was performed. If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.</p> <p>In the Surface water test, each GWB (with the relevant groundwater monitoring point) associated with the surface water body was assessed individually, taking into account the hydrological criterion, the hydrogeological criterion, the groundwater and surface water concentration profile, dilution (if data available) and that the estimated load of pollutant from groundwater transferred to associated surface water could be more than 50%, the GWB was evaluated in poor chemical status.</p> <p>In the DWPA test, the procedure was based on trend analysis (Mann-Kendal, linear regression, 10 years) of biological, chemical and radiological parameters of groundwater intended for human consumption before any level of treatment. If there was not a statistically significant and sustained upward trend in any drinking water abstraction points, the GWB was evaluated in good chemical status. If there was any significant and sustained upward trend in any parameter in any of drinking water abstraction point in the GWB, the methodology was as follows: the data aggregation to whole GWB was performed (kriging from 2 years mean). If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.</p> <p>Hungary: Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC.</p> <p>The following parameters were investigated:</p> <ol style="list-style-type: none"> a) Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate b) For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides). c) Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen. d) Based on these tests, groundwater body was evaluated. <p><u>Quantitative Status:</u></p>
-------------------------	--

	<p>Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> • <u>GW alteration (Drawdown) test</u> • Water Balance test • Surface Water Flow test • Groundwater Dependent Terrestrial Ecosystems (GWDTE) • Saline or other Intrusion test <p>Slovakia: Assessment of groundwater quantitative status consists of 4 tests:</p> <ol style="list-style-type: none"> 1. balance assessment of groundwater bodies for the period 2013-2017 and evaluation of the long-term trend of development of balance levels of groundwater bodies for the period 2004-2018 2. evaluation of the existence of significant declining trends in the groundwater level and spring yield in groundwater bodies for the period 2007-2016 processed by aggregation of point results of groundwater quantity monitoring in the facilities of the state hydrological network of the SHMI 3. assessment of the impact of groundwater quantity on the status of terrestrial ecosystems dependent on groundwater 4. assessment of the impact of groundwater quantity on surface water
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Slovakia: Drinking water, Surface water</p> <p>Hungary: Drinking water</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards, surface water standards) in the TV establishment:</u></p> <p>Slovakia: The natural background level (NBL) was determined and used to derive the threshold value (TV). The TV were determined for all indicators listed in Part B of Annex II to Directive 2006/118/EC and in Directive 2014/80/EU. The TV for the inorganic substances were derived according to the formula: $TV = (NBL + DWS)/2$. The TV for organic compounds were derived using the formula: $TV = 0.75 * DWS$. These TV were used for GQA and DWPA tests.</p> <p>An updated list of the TV established for each GWB was published in the amended Regulation of the Government of the Slovakia no. 282/2010 Coll.</p> <p>For the Surface water test, the TV were derived as follows: $TV = CV = AF * EQS$ (surface water standard)/DF, where AF (Attenuation factor) and DF (Dilution factor) are equal to 1 (the worst case).</p> <p>For that GWB where the NBL was higher than the TV due to natural hydro-geological reasons, the TV was set up as $TV = NBL$.</p> <p>Hungary: EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so the DWS is applicable. Exempt those cases, when the karstic and shallow GWBs are in direct relation to aquatic ecosystems (GWAAE), so here the EQS nitrate is applicable (25 mg/l) instead of 50 mg/l of DWS.</p> <p>For other components the DWS is applicable.</p> <p><u>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO4 and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</u></p>
Verbal description of the trend	<p>Slovakia: Trend is assessed separately for groundwater quality and quantity at which for trends in quantity the procedure applies for all GW quantity monitoring sites. The assessment follows a stepwise procedure. Consisting of the evaluation of the data sets and the monitoring points (no gaps in time series are allowed and data from 2007–2016 were used), consisting of</p>

assessment methodology	<p><i>the performance of the non-parametric Mann-Kendall trend test (95% confidence level) and comprising the regression analysis. GWBs with decreasing trends but with no evidence of abstraction are excluded from assessment in the 3rd RBMP. For assessing trends in concentrations of pollutants in groundwater the evaluation period was 2007–2016. The results of surveillance and operational monitoring were applied for the assessment. Monitoring frequency depends on the GWB type. In the analysis the values <LOQ are replaced by LOQmax/2. Trend assessment is only performed if the number of values <LOQ is less than 50%. Non-parametric Mann-Kendall test with 5% significance level was applied for trend evaluation. For time series showing a normal distribution, the statistical significance of the trend was also tested by the parametric method (ANOVA) with 5% significance level. Than for all times series with statistically significant upwards trends, the statistically significant upward trend was evaluated and identified if the median of the values measured over the last 2 years was higher than 0.75 * QS/TV or the calculated predicted value of the linear trend up to 2026 (regression model calculated by the least squares method or Sen's nonparametric procedure) was higher than QS/TV. The significant sustained upward trends of pollutant concentrations were identified at the level of monitoring points and at the GWB level.</i></p> <p><i>The starting point for trend reversal was placed where the concentration of the pollutant reaches 75% of the QS/TV of the relevant pollutant.</i></p> <p>Hungary: <i>To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Man-Kendall method with fitted Sen slope. The steps used for trend assessment were:</i></p> <ul style="list-style-type: none"> • <i>During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 datapoints.</i> • <i>The trend of groundwater body level aggregates of yearly annual data were assessed as well.</i> <p><i>Significant upward or downward trends were identified on 95 and 90% significance level using Man-Kendall method with Sen's slope.</i></p>				
Verbal description of the trend reversal assessment methodology	<p>Slovakia: <i>Trend reversal assessment methodology consists in the use of GWstat software. Time series were included in the assessment, on the basis of which significant sustained upward trends at the level of monitoring sites in the previous RBMP were classified. The time series entering the evaluation were supplemented by data monitored in previous years so that the evaluation period was 14 years. The evaluation was performed by dynamically dividing the time series into two sections with different lengths and then evaluating the statistical significance of the trends separately for each allocated section. A reversal of the trend was indicated if the following conditions were met at the same time: the statistical significance of the trends evaluated within individual sections is higher than the statistical significance of the trend evaluated on the basis of all data forming the evaluated time series, the section representing the results of monitoring in the older period shows a statistically significant upward trend, which is followed by a statistically significant decreasing trend evaluated on the basis of the results of monitoring in the newer period</i></p> <p>Hungary:</p>

Description/C haracterisation of the ICPDR GW-body	<p>Delineation: see GWB-8</p> <p>Reasons for selecting as important transboundary GWB</p> <p><i>The Middle and Upper-Triassic karstic dolomite and limestone formation of the northern part of the Transdanubian Mountain (Hungary) and the Komarnanska Kryha (Slovakia) belong to one of the largest karstic aquifer systems in Central Europe. It provides good quality drinking water for the population of the region in Hungary; it contributes to the characteristic landscape by supplying springs and the deeper part of the aquifer system is very important thermal water resources in both countries.</i></p> <p>General description</p> <p><i>The karstic formation of the northern part of the Transdanubian Mountains is composed mainly of Upper-Triassic dolomite and limestone. The considerable matrix porosity of the dolomite is due to the dense fissure-system, while in the limestone large fractures are characteristic along the faults. The elevated open karstic zones are separated by sunken basins, where the thickness of the covering layer is several hundred meters. Above the thermal part it exceeds 500 m of thickness (in some places it reaches even 2,500 m) consisting of different types of sediments: sand, clay, marl, sandstone, Eocene karstic formation with brown coal.</i></p>			

The Slovakian part (the Komarno block) extends between Komarno and Sturovo. It is fringed by the Danube River in the South and by the E-W Hurbanovo fault in the North. The southern limit along the Danube is tectonic as well and therefore the Komarno block is a sunken tract of the northern slope of the Gerecse and Pilis Mountains. The Komarno block consists largely of Triassic dolomites and limestones up to 1,000 m in thickness. The surface of the pre-Tertiary substratum plunges towards the north from a depth of approximately 100 m near the River Danube to as much as 3,000 m near the Hurbanovo fault.

The karstic aquifer is divided into six water bodies. In Hungary, where the recharge area appears, two water bodies bearing cold waters have been delineated according to the flow system. The thermal water bodies (in Hungary waters with temperature more than 30 °C is considered as thermal, while in Slovakia the limit is 25°C: HU_kt.1.2, HU_kt.1.4, SK_300010FK and SK_300020FK are in close hydraulic connection with the cold ones. To be noted, that the missing continuation of the cold water bodies in the Slovakian part is mainly due to the different consideration of the limit of temperature. Taking into account hydro-geothermal aspects, the deep Slovakian karstic aquifer is divided into the Komarno high block (SK 300010FK) and the Komarno marginal block (SK300020FK).

The Danube River is the regional erosion base of the water bodies. The water level fluctuation is in strong relation with the water level changes in the river. The water bodies are hydraulically connected. It is valid at the border of the countries as well, i.e. under the Danube and the Ipoly/Ipel Rivers, making the abstractions of water in both countries highly interrelated.

The recharge area is in the Hungarian side and the total recharge is estimated at 60 Mm³/y. Without abstraction this amount of water is discharged by the springs and by the upward flow towards the covering layer, and some part is infiltrating to the deeper, thermal part.

The temperature of the water abstracted (captured) from the Hungarian thermal water bodies does not exceed 60 °C. Heat-flow densities suggest that the Komarno high block can be characterised by a fairly low (thermal spring at Sturovo and Patince are 39 and 26 °C warm) and the marginal block by a medium geothermal activity (40–68 °C). Heat flow given in mW/m² is 50- 60 in Komárno high block and 60–70 mW/m² in Komárno marginal block, both considered as low values.

Coefficient of transmissivity in the high block varies from 13 to 100 m²/d, while in the marginal block between 4 to 20 m²/d. Prognostic recoverable amount of thermal water in the high block is estimated at 12,000 m³/d water of 20 to 40°C warm. In the marginal block the abstracted thermal water should be re-injected after use.

Major pressures and impacts

In Hungary the actual abstractions are apr. 30 M m³/y from the cold part and 2 M m³/y from the thermal part. In Slovakia the thermal water abstraction is 0.6 M m³/y mainly in area Komárno-Patince-Štúrovo. The cold karstic water is used for drinking water, the thermal water for balneology (in Hungary and in Slovakia) and for energy production (in Slovakia). Disposal of used geothermal water is solved in Slovakia by discharge into surface water (River Danube and Váh) after dilution with groundwater on acceptable qualitative parameters.

Due to the mining activities in the 20th century, the actual water levels - especially in the cold water bodies in the Hungarian side - are significantly lower than the long-term natural averages and as a consequence all cold and lukewarm karstic springs dried out. In the Slovak side the regime of geothermal water (decreasing discharges of wells) was also affected by the extensive pumping of karstic water from coal mines in Tatabánya and Dorog (Hungary). After the mining was stopped (in 1993), the water levels have been showing increasing trend and the gradual reappearance of the springs is forecasted in the coming 5–15 years.

The abandoned cuts and fields of mine submerged by the rising karstic water represent a potential pollution source. Water quality monitoring has been installed, but data are not sufficient for estimating future impacts.

In extremely vulnerable open karstic area a few settlements should be considered as potential source of pollution. Relatively a high number of significant pollution exists in the area (40). The majority is lying above the not vulnerable covered part. The average amount of Nitrogen fertilizer is 86 kgN/ha/year, the use of manure is insignificant (3 kgN/ha/year). The surplus Nitrogen from agriculture is 17 kgN/ha/year, but in the majority of the area the thick covering layers provide natural protection. (Localities in real danger should be assessed at smaller scale, focusing on open karstic zones).

<p>Description of status assessment methodology.</p>	<p>Chemical Status</p> <p>Hungary: Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC.</p> <p>The following parameters were investigated:</p> <ol style="list-style-type: none"> Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides). Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen. Based on these tests, groundwater body was evaluated. <p>Slovakia: An important factor in assessing the chemical status of geothermal waters, especially in terms of their use, is the stability of their chemical composition. The stability of the chemical composition for individual sources will be evaluated in those indicators that characterize the chemical type of water (Mineralization, Ca, Mg, Na, Cl, HCO₃, SO₄). Another method is the evaluation of the development trend of the mentioned indicators in individual sources of the geothermal unit. The interquartile range (IQR) method was chosen to evaluate the chemical stability of geothermal water.</p> <p>Good chemical status is if :</p> <ul style="list-style-type: none"> the main indicators of the chemical type of water are between the lower and upper dispersion limits, the trend of development of components of the chemical type of water reaches the same course and individual deviations can be described from the source regime. <p>Quantitative Status</p> <p>Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:</p> <ul style="list-style-type: none"> <u>GW alteration (Drawdown) test</u> Water Balance test Surface Water Flow test Groundwater Dependent Terrestrial Ecosystems (GWDTE) Saline or other Intrusion test <p>Slovakia: The assessment of the quantitative status of geothermal groundwater bodies consists of the balance assessment of individual bodies and the identification of sources for which a critical or emergency balance state occurred during the use of groundwater during the monitored period (2015-2017). For comparison, the state of balance in the period between the geothermal bodies, each will use the value of balance taking into account the state transformed usable amounts expressed in % (BST).</p> <p>Good quantitative status is, if:</p> <ul style="list-style-type: none"> the balance value of the BsT geothermal unit for the observed period may not exceed the value of 80%,
--	--

	<ul style="list-style-type: none"> the trend of development of BsT values <70% is not marked, for BsT> 70% we mark the trend with signs, in case of occurrence of sources with critical or emergency balance state $B_s \leq 1,18$ - definition of causes. 				
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Hungary: Drinking water standards</p> <p>Slovakia:</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards) in the TV establishment:</u></p> <p>Hungary: EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so the DWS is applicable. Exempt those cases, when the karstic and shallow GWBs are in direct relation to aquatic ecosystems (GWAAE), so here the EQS nitrate is applicable (25 mg/l) instead of 50 mg/l of DWS.</p> <p>For other components the DWS is applicable.</p> <p>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO₄ and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</p> <p>Slovakia: The criterion for evaluating the chemical status of geothermal GWB is the stability of the chemical composition as was described above.</p>				
Verbal description of the trend assessment methodology	<p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Mann-Kendall method with fitted Sen slope. GWB-12: Ipel /Ipoly

GWB-12	National share	HU-12 SK-12	Status 2021 for each national GWB?	
			Chemical (substance)	Quantity
List of individual GW-bodies forming the whole national share (national code incl. country code)	HU	HUAIQ583	Good	Good
	SK	SK1000800P	Poor (NO ₃ , SO ₄ , PO ₄)	Good
Description/C characterisation of the ICPDR GW-body	<p>Delineation:</p> <p>The Ipoly-valley is situated in the border of Slovakia and Hungary, east of Danube River. Its area is 145,8 km², the elevation varies between 290 m asl to 128 m asl. The middle Ipoly-valley has an east to west direction, while the lower Ipoly-valley is a north to south one. Left side of the river belongs to Hungary. The middle-Ipoly valley formed by several young refilling trenches, on the south is separated by a defined morphological barrier showing terrace-like river valley. Several river terraces forms the lower-Ipoly-valley between the Börzsöny and Helemba hills. Morphologically, it is a diverse pediment surface from the level of the river up to 200 m asl.</p> <p>Reasons for selecting as important transboundary GWB:</p> <p>The surrounding area of this aquifer suffers from lack of water, while these groundwater bodies are important local drinking water resources in Slovakia and Hungary. Therefore, collaboration between SK and HU to delineate the HU and SK GWBs as common transboundary GWB is a key to maintain safe water supply in sufficient quantities. The alluvial deposits of the Ipel/ Ipoly River extend on both sides of the Hungarian-Slovakian border. The aquifer supplies drinking water to a population of approx. 170,000 inhabitants in Slovakia and 50,000 inhabitants in Hungary. On the Hungarian side, due to the lowland character and upward flow system, the terrestrial ecosystems (NATURA 2000 site) require surplus transpiration from groundwater; 7% of the area of the water body is under nature conservation. The recharge zone is in Slovakia and Hungary thus the available groundwater resource and the status of the terrestrial ecosystems depend on the lateral flow from the neighbouring countries. Both sides of the GWBs have issues with groundwater quality problems. The Ipel/ Ipoly River had formed a 0-10 meters thick alluvial deposit, along the stretch of approximately 80km of the river, which forms a natural boundary between Slovakia and Hungary. More importantly, hydraulic connection between the SK1000800P – HUAIQ583 groundwater bodies is anticipated (http://www.all-in.sk/enwat/ipel.html).</p> <p>General description:</p> <p>The middle and the lower part of the Ipoly-valley significantly differ in geology. In the area of upper-Ipoly-valley, the maximum 10 meters thick soil covers the alluvial sand, sandy gravel sediments. Below the maximum few tenth meters thick Holocene-Pleistocene sequence, several hundred meters thick Oligocene schlier, sandstone, clay sequence (Szécsényi schlier, Pétervásárai sandstone, Kiscelli clay and Hárshegy sandstone) covers the schist and gneiss basement. In the area of lower-Ipoly-valley below the few meters thick alluvial sand and gravel sediment few hundred meters thick Miocene marl, limestone sequence (Lajta limestone, Szilágy clayly marl) covers the magmatic tuffs (Nagyvölgyi Dacite tuffs) sediments.</p> <p>The lower boundary of the groundwater body is formed by the thick low permeability schlier and sandstone formations, respectively thick clayly marl aquitard (Szilágyi clayly marl). In the</p>			

	<p>river terraces the Pleistocene fluvio- eolian sand and loess is a good water bearing strata, however the main aquifer is the few meters thick (4 m in average) Holocene fluvial sand and gravel along the river. The recharge of the upper part of the river is in Slovakia, while the middle and lower part of it is recharged both side of the river.</p> <p>The area of interest is delimited by the extent of the youngest alluvium of the river Ipoly/Ipel' and partially also of some of its tributaries. The alluvium lies on the impermeable clayey sediments of the Neogene filling of the Juhoslovenská and Podunajská panva basins in the Slovakian side. In the groundwater body there are mainly alluvial and terrestrial gravel, sandy gravel, sand, stratigraphic classification of Pleistocene - Holocene as collector rocks. In hydrogeological collectors of the formation, the inter-grain permeability prevails. The average range of the thickness of the guardrails is <10 m, the value of the filtration coefficient here is in the range of $1 \cdot 10^{-4}$ to $1 \cdot 10^{-3}$ m.s⁻¹. The general direction of groundwater flow in the alluvial floodplain of the quaternary formation SK1000800P is more or less parallel to the course of the main flow. Intergranular groundwater body of Quaternary sediments of the Ipel' river is in the Hron watershed area. The evaluated area (agricultural land including arable land, grassland, pastures and permanent crops plantations) shares 86.69 % of total groundwater body area, rest of groundwater body area land cover is represented by forests, semi-natural land, surface water tables and artificial surfaces. Within the groundwater body area, evaluated area creates large and compact patterns which regularly cover whole area. In general, groundwater body shows lowered potential of soil regarding possible negative influence of surface contamination to groundwater.</p> <p>The main aquifer is the alluvial sediments of the river Ipoly/Ipel' and the connecting terraces. Their thickness is about 4-10 m, or more. The gravels and sands are covered with 1.5-4 m of clayey flood sediments. The changing thickness sometimes causes the occurrence of the confined groundwater. The gravels and sands have high transmissivity. The width of the river flood plain is about 1-2 km, but at some places it is of only tens of meters. Groundwater recharge occurs by infiltration of precipitations and infiltration of surface water at high water levels. The changing (decreasing) surface water level of the river has negative impact of the water supply possibilities Strong variability of groundwater chemical composition and quality is characteristic for the Ipel' region. Ca-Mg-HCO₃ dominates in groundwater as the result of dissolution of carbonates and hydrolytical decomposition of silicate minerals. Groundwater qualitative properties in the region reflect either the natural character of the area or the addition of compounds due to anthropogenic activities.</p> <p>Major pressures and impacts</p> <p>Anthropogenic contamination of groundwater is mostly originated by agricultural activities and production of waste waters. It is mainly contamination of the uppermost groundwater horizons that occurs in the area. Deteriorated groundwater quality is mainly characterized by high contents of nitrates, chlorides, ammonia ions, phosphates or specific organic parameters (PAH, COD) and occasionally pesticides. Locally high pesticide concentrations (> 0.5 mg/l) are found in both surface water and in groundwater along the Ipoly/Ipel' valley. Pesticides in unsaturated soils can be released by erosion, which can be increased by climate change. Nitrates have also a substantial impact on the shallow parts (0-20 m) of the groundwater systems. In general, detected pesticide concentrations suggest that water quality can be considered to be at risk until further investigations will be made and the additional measures as defined by WFD, will be taken. Furthermore, besides the anthropogenic pressures the locally important drinking water resource has high natural sulphate content and electric conductivity. The whole GWB is highly sensitive to climatic changes</p>
Description of status assessment methodology.	<p><u>Chemical Status:</u></p> <p>Hungary: Assessment of the chemical status of groundwater was conducted: Analysing of the chemical data of individual monitoring points within each of the GWBs; Identifying of the pressures - sources of pollution; The background levels were calculated and used to determine threshold value. Threshold values have been determined according to CIS Guidance No. 18. Contamination limits have been determined for all indicators listed in Annex II Part B of Directive 2006/118/EC and indicators of the report under Art. 5 of Directive 2006/118/EC. The following parameters were investigated:</p> <p>a) Natural Background Level was determined for the following components: nitrate, ammonium, specific conductivity, sulphate, chloride, arsenic, cadmium, lead, mercury, orthophosphate</p>

- b) For each monitoring point the median concentration of each parameters of the studied period was compared to the thresholds values (determined for each GWB) or standards values (in the case of nitrates, metals and pesticides).
- c) Different tests were conducted to assess groundwater body status: Diffuse pollution test (nitrate, ammonium, orthophosphate), Drinking water supply tests for numerous elements or components in both drinking water wells and monitoring wells and trend analysis based on the data of the surveillance monitoring system. Studied components of these tests are: nitrate, ammonium, chloride, sulphate, specific conductivity, mercury, lead, cadmium, pesticides and organics, furthermore in the trend analysis pH and dissolved oxygen.
- d) Based on these tests, groundwater body was evaluated.

Slovakia: The methodology for assessing chemical status followed the requirements of the Groundwater Directive (2006/118/EC) as well as the recommendations of the CIS Guidance Document no. 18 - Guidance on groundwater status and trend assessment. The assessment of the chemical status of GWB in the conditions of the Slovakia consisted of the following tests:

1. General quality assessment (GQA) test - years 2016-2017.
2. Drinking water protected areas (DWPA) test - period 2008-2017.
3. Test of significant diminution of associated surface water chemistry and ecology due to transfer of pollutant from the GWB - named as Surface water test - period 2013-2018.

In the GQA test and the Surface water test, the procedure was based on a comparison of the arithmetic means of the concentration of the individual component with quality standards (QS) or thresholds values (TV) for each monitoring point. If no exceedances of the QS/TV were recorded in all monitoring points, the whole GWB was evaluated in good chemical status. If exceedances of QS/TVs were recorded than the methodologies were as follows:

In the GQA test, data aggregation to whole GWB was performed. If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status.

In the Surface water test, each GWB (with the relevant groundwater monitoring point) associated with the surface water body was assessed individually, taking into account the hydrological criterion, the hydrogeological criterion, the groundwater and surface water concentration profile, dilution (if data available) and that the estimated load of pollutant from groundwater transferred to associated surface water could be more than 50%, the GWB was evaluated in poor chemical status.

In the DWPA test, the procedure was based on trend analysis (Mann-Kendal, linear regression, 10 years) of biological, chemical and radiological parameters of groundwater intended for human consumption before any level of treatment. If there was not a statistically significant and sustained upward trend in any drinking water abstraction points, the GWB was evaluated in good chemical status. If there was any significant and sustained upward trend in any parameter in any of drinking water abstraction point in the GWB, the methodology was as follows: the data aggregation to whole GWB was performed (kriging from 2 years mean). If the calculated total area of exceedance of the QS/TV was less than 20% of the total area of the GWB, the GWB was evaluated in good status. If the exceedance more than 20% of the total area of the GWB was recorded and based on expert judgment, the GWB was evaluated in poor chemical status

Quantitative Status:

Hungary: To determine the overall quantitative status for a GWB, a series of tests should be applied that considers the impacts of anthropogenically induced long-term alterations in groundwater level and/or flow. Each test will assess whether the GWB is meeting the relevant environmental objectives. The quantitative status has been assessed taking into account CIS Guidance No.18. The following criteria have been used:

- GW alteration (Drawdown) test
- Water Balance test
- Surface Water Flow test
- Groundwater Dependent Terrestrial Ecosystems (GWDTE)
- Saline or other Intrusion test

	<p>Slovakia: Assessment of groundwater quantitative status consists of 4 tests:</p> <ol style="list-style-type: none"> 1. balance assessment of groundwater bodies for the period 2013-2017 and evaluation of the long-term trend of development of balance levels of groundwater bodies for the period 2004-2018 2. evaluation of the existence of significant declining trends in the groundwater level and spring yield in groundwater bodies for the period 2007-2016 processed by aggregation of point results of groundwater quantity monitoring in the facilities of the state hydrological network of the SHMI 3. assessment of the impact of groundwater quantity on the status of terrestrial ecosystems dependent on groundwater 4. assessment of the impact of groundwater quantity on surface water
Groundwater threshold value relationships	<p><u>Receptors considered</u></p> <p>Slovakia: Drinking water, Surface water</p> <p>Hungary: Drinking water</p> <p><u>Consideration of NBL and EQS (environmental quality standards, drinking water standards, surface water standards) in the TV establishment:</u></p> <p>Slovakia: The natural background level (NBL) was determined and used to derive the threshold value (TV). The TV were determined for all indicators listed in Part B of Annex II to Directive 2006/118/EC and in Directive 2014/80/EU. The TV for the inorganic substances were derived according to the formula: $TV = (NBL + DWS)/2$. The TV for organic compounds were derived using the formula: $TV = 0.75 * DWS$. These TV were used for GQA and DWPA tests.</p> <p>An updated list of the TV established for each GWB was published in the amended Regulation of the Government of the Slovakia no. 282/2010 Coll.</p> <p>For the Surface water test, the TV were derived as follows: $TV = CV = AF * EQS$ (surface water standard)/DF, where AF (Attenuation factor) and DF (Dilution factor) are equal to 1 (the worst case).</p> <p>For that GWB where the NBL was higher than the TV due to natural hydro-geological reasons, the TV was set up as $TV = NBL$.</p> <p>Hungary: EQS for herbicides and total pesticides, tri-, tetrachloroethylenes based on 201/2001. (X.25.) Gov. decree and the 6/2009. (IV.14.) KvVM-EüM-FVM common ministerial decree in correspondence to I. Annex of the 2006/118/EC directive.</p> <p>In Hungary, more than 95% of drinking water ensured from subsurface waters, so for all other components the DWS is applicable.</p> <p><u>For those GWBs where the NBL was higher than the DWS due to natural hydro-geological reasons, the TVs for ammonium, SO₄ and EC were defined by taking into account these higher values, as described in Guidance Document No. 18.</u></p>
Verbal description of the trend assessment methodology	<p>Slovakia: Trend is assessed separately for groundwater quality and quantity at which for trends in quantity the procedure applies for all GW quantity monitoring sites. The assessment follows a stepwise procedure. Consisting of the evaluation of the data sets and the monitoring points (no gaps in time series are allowed and data from 2007–2016 were used), consisting of the performance of the non-parametric Mann-Kendall trend test (95% confidence level) and comprising the regression analysis. GWBs with decreasing trends but with no evidence of abstraction are excluded from assessment in the 3rd RBMP. For assessing trends in concentrations of pollutants in groundwater the evaluation period was 2007–2016. The results of surveillance and operational monitoring were applied for the assessment. Monitoring frequency depends on the GWB type. In the analysis the values <LOQ are replaced by $LOQ_{max}/2$. Trend assessment is only performed if the number of values <LOQ is less than 50%. Non-parametric Mann-Kendall test with 5% significance level was applied for trend evaluation. For time series showing a normal distribution, the statistical significance of the trend was also tested by the parametric method (ANOVA) with 5% significance level. Than for all times series with statistically significant upwards trends, the statistically significant upward trend was evaluated and identified if the median of the values measured over the last 2 years was higher than $0.75 * QS/TV$ or the calculated predicted value of the linear trend up to 2026 (regression model calculated by the least squares method or Sen's nonparametric procedure)</p>

	<p>was higher than QS/TV. The significant sustained upward trends of pollutant concentrations were identified at the level of monitoring points and at the GWB level.</p> <p>The starting point for trend reversal was placed where the concentration of the pollutant reaches 75% of the QS/TV of the relevant pollutant.</p> <p>Hungary: To assess the trend of pollutant concentrations, chemical data of the surveillance monitoring systems were used for the period of 2000 to 2012. The trend analysis was done using Matlab program package of Mann-Kendall method with fitted Sen slope. The steps used for trend assessment were:</p> <ul style="list-style-type: none"> • During the assessment trend of all components for all monitoring objects were created using yearly average data and excluding time series with less than 4 data points. • The trend of groundwater body level aggregates of yearly annual data were assessed as well. <p>Significant upward or downward trends were identified on 95% significance level using Mann-Kendall method with Sen's slope.</p>				
Verbal description of the trend reversal assessment methodology	<p>Slovakia: Trend reversal assessment methodology consists in the use of GWstat software. Time series were included in the assessment, on the basis of which significant sustained upward trends at the level of monitoring sites in the previous RBMP were classified. The time series entering the evaluation were supplemented by data monitored in previous years so that the evaluation period was 14 years. The evaluation was performed by dynamically dividing the time series into two sections with different lengths and then evaluating the statistical significance of the trends separately for each allocated section. A reversal of the trend was indicated if the following conditions were met at the same time: the statistical significance of the trends evaluated within individual sections is higher than the statistical significance of the trend evaluated on the basis of all data forming the evaluated time series, the section representing the results of monitoring in the older period shows a statistically significant upward trend, which is followed by a statistically significant decreasing trend evaluated on the basis of the results of monitoring in the newer period.</p> <p>Hungary: To assess the trend reversal of pollutant concentrations two consecutive time period was compared and evaluated</p>				
Threshold values per GWB

Groundwater measures

The overview table indicates the status of implementation of all key measures in the following way:

MC	Measure implementation Completed by end of 2020 <i>Implementation of measure is estimated to be completed by the end of 2020</i>
MO	Measure implementation On-going after the end of 2020 (Involving administrative acts, diffuse pollution, advisory services, research etc.)
PO	Construction Planning On-going after the end of 2020 <i>Planning of construction measure is on-going.</i> (Involving construction or building works)
CO	Construction On-going after the end of 2020 <i>Construction of measure is on-going.</i> (Involving construction or building works)
MP	Measure implementation Not Started by the end of 2020 <i>Implementation of measure is planned</i>
MN	Measure implementation Not Started by the end of 2020

The detailed tables provide more details on particular measures in each relevant GWB:

- description of the measure,
- responsible authority,
- quantitative information by appropriate indicators (number of measures/projects and costs).

GWBs at poor status in 2021 or at risk in 2027 and the implemented measures

Detailed description of measures

[BM = basic measures, OBM = other basic measures, SM = supplementary measures].

GWB-4: Sarmatian

GWB Code	Size [km ²]	Pressures		Status/Risk		Measures		Exemptions
		Chemical	Quantity	Chemical	Quantity	Chemical	Quantity	
GWB-4 BG-RO	5,412	DS	-	Poor, Risk (RO)	Good	BM, SM	-	2027
MC - Measure implementation completed by the end of 2020								
MO - Measure implementation on-going after the end of 2020								
RO – Chemical:								
BM-03 Ensuring the protection areas for the drinking groundwater abstraction (MO)								
<ul style="list-style-type: none"> • description of the measure: establishment of safeguard zones and buffer zones ensuring the protected area according to the water legislation in force (Water Law 107/1996 modified and completed, GD 930/2005 and Order 1278/2011); banning measures for some activities and restricted use of land, in order to prevent the water contamination risk/ • responsible authority: water authorities, local authorities; • quantitative information: according with the Water Law 107/1996 as amended and GD 930/2005, for all drinking groundwater abstractions are establishing the safeguard zones and buffer zones, in order to prevent the water resources contamination. 								
BM-09 Applying the Action Programs (whole territory approach) in accordance to the Nitrates Directive (MO)								
<p>In Romania, following the discussions with the EC, whole territory approach is applied according with Decision 221983/GC/12.06.2013 of the Inter-ministerial Commission for the implementation of the Action Programs for the protection of waters against pollution caused by nitrates from agricultural sources.</p> <ul style="list-style-type: none"> • description of the measure – programme of measures applied for the agriculture diffuse sources in order to reduce the effects of the agriculture activities • responsible authority: county agriculture authorities, local authorities and farmers • quantitative information by appropriate indicators: This measure is applied in whole Dobrogea-Litoral Water Basin Administration territory. 								
SM - Research study for evaluation of the type and quantity of pollutants in soil and groundwater and the transfer/degradation mechanisms (MO)								
<ul style="list-style-type: none"> • description of the measure: development of modelling tools for the evaluation of spatial and temporal pollutants migration – the support tool for finalising the evaluation methodology of the groundwater status and of the pollutant trends. • responsible authority: Ministry of Environment, Waters and Forests, National Administration "Romanian Waters", National Institute for Hydrology and Water Management. • quantitative information by appropriate indicators: research study 								
PO - Construction measure planning on-going after the end of 2020								
CO - Construction of measure on-going after the end of 2020								
RO – Chemical:								
BM – 07 Construction of collecting system (CO)								
<ul style="list-style-type: none"> • description of the measure – execution of the new sewage networks • responsible authority: local authority 								

- **quantitative information** construction of collecting systems and improvement of the waste water treatment plant performance

MN - Measure implementation not started by the end of 2020

GWB-5: Mures/Maros

GWB Code	Size [km ²]	Pressures		Status/Risk		Measures		Exemptions
		Chemical	Quantity	Chemical	Quantity	Chemical	Quantity	
GWB-5 HU-RO	7,216	DS	WA	Poor, Risk (RO, HU)	Poor, Risk (HU)	BM, OBM, SM	OBM, SM	2027+ (HU) 2027 (RO)
MC - Measure implementation completed by the end of 2020								
MO - Measure implementation on-going after the end of 2020								
RO – Chemical:								
BM-03 Ensuring the protection areas for the drinking groundwater abstraction (MO)								
<ul style="list-style-type: none"> • description of the measure: establishment of safeguard zones and buffer zones ensuring the protected area according to the water legislation in force (Water Law 107/1996 modified and completed, GD 930/2005 and Order 1278/2011); banning measures for some activities and restricted use of land, in order to prevent the water contamination risk/ • responsible authority: water authorities, local authorities; • quantitative information: according with the Water Law 107/1996 as amended and GD 930/2005, for all drinking groundwater abstractions are establishing the safeguard zones and buffer zones, in order to prevent the water resources contamination. 								
BM-09 Applying the Action Programs (whole territory approach) in accordance to the Nitrates Directive (MO)								
In Romania, following the discussions with the EC, whole territory approach is applied according with Decision 221983/GC/12.06.2013 of the Inter-ministerial Commission for the implementation of the Action Programs for the protection of waters against pollution caused by nitrates from agricultural sources.								
<ul style="list-style-type: none"> • description of the measure – programme of measures applied for the agriculture diffuse sources in order to reduce the effects of the agriculture activities • responsible authority: county agriculture authorities, local authorities and farmers • quantitative information by appropriate indicators: This measure is applied in whole Dobrogea-Littoral Water Basin Administration territory. 								
SM - Research study for evaluation of the type and quantity of pollutants in soil and groundwater and the transfer/degradation mechanisms (MO)								
<ul style="list-style-type: none"> • description of the measure: development of modelling tools for the evaluation of spatial and temporal pollutants migration – the support tool for finalising the evaluation methodology of the groundwater status and of the pollutant trends. • responsible authority: Ministry of Environment, Waters and Forests, National Administration "Romanian Waters", National Institute for Hydrology and Water Management. • quantitative information by appropriate indicators: research study 								
HU – Chemical:								
BM-07								
<ul style="list-style-type: none"> • description of the measure: BM07 • responsible authority: local governments • quantitative information by appropriate indicators (number of measures/projects and costs): 								

HU transposed the Urban Waste Water Directive by Gov. decree 25/2002. (II. 27.) on the National Wastewater Collection and Treatment program. The implementation of UWWWD is ongoing. In the South Great Plain Region the rate of the settlements connected to the sewage system was 71,9 % in 2019.

BM-08

- **description of the measure:** BM08
- **responsible authority:** plant protection authority
- **quantitative information by appropriate indicators (number of measures/projects and costs):**
Implementation of EU the plant protection action program required by Sustainable Use of Pesticides Directive in the territory of the whole country with special regard to sensitive areas like drinking water protection zones, buffer strips of surface waters, etc. with additional voluntary measures planned under CAP 2021-27.

BM-09

- **description of the measure:** BM09
- **responsible authority:** authorities for soil protection and for water protection
- **quantitative information by appropriate indicators (number of measures/projects and costs):**
HU transposed the ND by the Gov. Decree No. 27/2006. (II.7.) on the protection of waters against pollution caused by nitrates of agricultural sources. Designation of nitrate vulnerable zones was revised in 2013 (NVZ; ~69% of Hungary) . The Code of Good Agricultural Practice (GAP) is obligatory on NVZ's. Outside the NVZ's, the agri environmental measures assist the implementation of GAP on a voluntary basis.

RO – Quantity:

OBM-23

- **description of the measure** - In Romania, the measures (basic and other basic measures) are taken for all groundwater bodies (even if they are in good status), to prevent deterioration of groundwater bodies status but also taking into consideration the precautionary principle.
- **responsible authority:** water authorities, local authorities
- **quantitative information by appropriate indicators:** according with the Water Law 107/1996, Annex 3 (C) as amended, the groundwater abstraction shall be authorized and controlled, and the water abstraction register is regularly update.

HU – Quantity:

SM: measure for the inland excess water retention

OBM-23: development of water information system concerning the electronic-authorisation; New regulation on water management elaborated to take action against the installation and use of illegal agricultural water wells.

PO - Construction measure planning on-going after the end of 2020

CO - Construction of measure on-going after the end of 2020

RO – Chemical:

BM-07 Construction of collecting system (CO)

- **description of the measure** – execution of the new sewage networks
- **responsible authority:** local authority
- **quantitative information** construction of collecting systems and improvement of the waste water treatment plant performance
-

MN - Measure implementation not started by the end of 2020

HU – Chemical:

OBM-22

- **description of the measure:** OBM22 – protection of water abstractions
- **responsible authority:** authorities for water protection and water management

- **quantitative information by appropriate indicators (number of measures/projects and costs):**

The protection of drinking water abstraction sites is regulated by 123/1997. (VII. 18.) Gov. Decree, acc. to which protection zones of sensitive abstraction sites have to be revised every 10 years. Revision includes i. a. the review of potential pollution sources and activities in the protection zones and their impacts on water quality and taking restrictive measures or additional monitoring if necessary. In addition to the implementation of the risk-based approach in the protection zones of drinking water abstraction acc. to the new Drinking Water Directive, other basic measures to support water protective agricultural practices, e. g. forestation, special practices for areas prone to erosion, excess water or droughts, will be introduced and subsidised by CAP 2021-27.

OBM-26

- **description of the measure:** OBM26 – poll. diffuse

- **responsible authority:** authorities for soil protection and for water protection

- **quantitative information by appropriate indicators (number of measures/projects and costs):**

New compulsory and voluntary measures to reduce erosion and prevent nutrient (esp. phosphorus) inputs into waters in CAP 2021-27 are under elaboration.

SM - Supplementary Measures

- **description of the measure:** SM – education

- **responsible authority:** Ministry of Agriculture, farmers' advisors

- **quantitative information by appropriate indicators (number of measures/projects and costs):**

Expand farmers' advisory system and introduce consultation for farmers on water protecting agricultural practices in the fields of sustainable nutrient and pesticide management, water saving cultivation practices, irrigation, natural water retention, erosion to assist to a successful application and use of CAP subsidies, both compulsory and voluntary.

- **description of the measure:** SM – research, development – kiegészítő intézkedés

- **responsible authority:** Ministry of Interior, Ministry of Agriculture

- **quantitative information by appropriate indicators (number of measures/projects and costs):**

The request "Strengthening water monitoring in Hungary" (21HU07) for support under the first round of the Technical Support Instrument (TSI 2021) has been preliminarily accepted for funding by DG Reform. The project aims at ensuring high-quality monitoring and processing of water related information, integration of monitoring activity of the aquatic environment (soil, ecosystem, water, air) between sectors and organizations and closing the gap between research to practical application. (Planned budget: 650 000€, expected end: 2022)

GWB-7: Upper Pannonian – Lower Pleistocene / Vojvodina / Duna-Tisza köze deli r.

GWB Code	Size [km ²]	Pressures		Status/Risk		Measures		Exemptions
		Chemical	Quantity	Chemical	Quantity	Chemical	Quantity	
GWB-7 HU-RO-RS	28,959	DS	WA	Poor, Risk (HU)	Poor, Risk (HU, RS*)	BM, OBM, SM	OBM, SM	2027+ (HU) YYYY (RS*)

MC - Measure implementation completed by the end of 2020

HU - Quantity

SM: measures from the CAP in order to protect the groundwater resources (CAP planning is ongoing)

OBM-23: development of water information system concerning the electronic-authorisation; New regulation on water management elaborated to take action against the installation and use of illegal agricultural water wells.

MO - Measure implementation on-going after the end of 2020

HU – Chemistry**BM-07**

- **description of the measure:** BM07
- **responsible authority:** local governments
- **quantitative information by appropriate indicators (number of measures/projects and costs):**

HU transposed the Urban Waste Water Directive by Gov. decree 25/2002. (II. 27.) on the National Wastewater Collection and Treatment program. The implementation of UWWD is ongoing. In the South Great Plain Region the rate of the settlements connected to the sewage system was 71,9 % in 2019.

BM-08

- **description of the measure:** BM08
- **responsible authority:** plant protection authority
- **quantitative information by appropriate indicators (number of measures/projects and costs):**

Implementation of EU the plant protection action program required by Sustainable Use of Pesticides Directive in the territory of the whole country with special regard to sensitive areas like drinking water protection zones, buffer strips of surface waters, etc. with additional voluntary measures planned under CAP 2021-27.

BM-09

- **description of the measure:** BM09
- **responsible authority:** authorities for soil protection and for water protection
- **quantitative information by appropriate indicators (number of measures/projects and costs):**

HU transposed the ND by the Gov. Decree No. 27/2006. (II.7.) on the protection of waters against pollution caused by nitrates of agricultural sources. Designation of nitrate vulnerable zones was revised in 2013 (NVZ; ~69% of Hungary) . The Code of Good Agricultural Practice (GAP) is obligatory on NVZ's. Outside the NVZ's, the agri environmental measures assist the implementation of GAP on a voluntary basis.

PO - Construction measure planning on-going after the end of 2020**CO - Construction of measure on-going after the end of 2020****MN - Measure implementation not started by the end of 2020****HU – Chemistry****OBM-22**

- **description of the measure:** OBM22 – protection of water abstractions
- **responsible authority:** authorities for water protection and water management
- **quantitative information by appropriate indicators (number of measures/projects and costs):**

The protection of drinking water abstraction sites is regulated by 123/1997. (VII. 18.) Gov. Decree, acc. to which protection zones of sensitive abstraction sites have to be revised every 10 years. Revision includes i. a. the review of potential pollution sources and activities in the protection zones and their impacts on water quality and taking restrictive measures or additional monitoring if necessary. In addition to the implementation of the risk-based approach in the protection zones of drinking water abstraction acc. to the new Drinking Water Directive, other basic measures to support water protective agricultural practices, e. g. forestation, special practices for areas prone to erosion, excess water or droughts, will be introduced and subsidised by CAP 2021-27.

OBM-26

- **description of the measure:** OBM26 – poll. diffuse
- **responsible authority:** authorities for soil protection and for water protection
- **quantitative information by appropriate indicators (number of measures/projects and costs):**

New compulsory and voluntary measures to reduce erosion and prevent nutrient (esp. phosphorus) inputs into waters in CAP 2021-27 are under elaboration.

SM - Supplementary Measures

- **description of the measure:** SM – education
- **responsible authority:** Ministry of Agriculture, farmers' advisors
- **quantitative information by appropriate indicators (number of measures/projects and costs):**
Expand farmers' advisory system and introduce consultation for farmers on water protecting agricultural practices in the fields of sustainable nutrient and pesticide management, water saving cultivation practices, irrigation, natural water retention, erosion to assist to a successful application and use of CAP subsidies, both compulsory and voluntary.
- **description of the measure:** SM – research, development

The request "Strengthening water monitoring in Hungary" (21HU07) for support under the first round of the Technical Support Instrument (TSI 2021) has been preliminarily accepted for funding by DG Reform. The project aims at ensuring high-quality monitoring and processing of water related information, integration of monitoring activity of the aquatic environment (soil, ecosystem, water, air) between sectors and organizations and closing the gap between research to practical application. (Planned budget: 650 000€, expected end: 2022)

Note

* The National Plan for the Republic of Serbia is still in progress (available as draft), therefore, the year for exemptions as well as information on measures for the national part of GWB 7 which is in quantitative risk cannot be provided before the deadline of data collection of this overview. The information will be provided, when the Plan is officially adopted.

GWB-8: Podunajska Basin, Zitny Ostrov / Szigetköz, Hanság-Rábca

GWB Code	Size [km ²]	Pressures		Status/Risk		Measures		Exemptions
		Chemical	Quantity	Chemical	Quantity	Chemical	Quantity	
GWB-8 HU-SK	3,338	PS, DS		Risk (SK)	Good	BM, SM		

MC - Measure implementation completed by the end of 2020**MO - Measure implementation on-going after the end of 2020****SK – Chemical****BM-03 Drinking water protected areas (DWPA)**

- **description of the measure:** Reconsider the safeguard zone and restrictions in the DWPA, if they are sufficient to protect the quality of drinking water sources.
- **responsible authority:** Slovak Environmental Inspection, Ministry of Agriculture and Rural Development of the Slovak Republic
- **quantitative information by appropriate indicators:** DWPA Žitný ostrov (area 1200 km²)

BM-08 Plant protection products

- **description of the measure:** Continue to meet the requirements arising from the implementation of European Parliament and Council Directive 2009/128/EC concerning the reduction of pesticides pollution from agriculture and implementation of this Directive into national Law and National action programme to achieve sustainable use of pesticides. Continue to apply measure concerning the placing of plant protection products on the market according to Regulation No. 1107/2009 of the EU Parliament and of the Council.
- **responsible authority:** Central Control and Testing Institute in Agriculture, Ministry of Agriculture and Rural Development of the Slovak Republic

- **quantitative information by appropriate indicators:**

BM-09 Nitrates Directive

- **description of the measure:** Continuing in application of requirements of the Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources (Nitrates Directive). The Nitrates Directive requires the fulfilment of the task of the Action Programme, which is established in the SR by Act no. 136/2000 Coll. on fertilizers.
- **responsible authority:** Ministry of Agriculture and Rural Development of the Slovak Republic, Central Control and Testing Institute in Agriculture
- **quantitative information by appropriate indicators:** This measure is applied in groundwater body's vulnerable areas (1694 km²) according to Government Regulation no. 174/2017 Coll. (will be revised in 2021/2022).

SM - Supplementary Measures

- Remediation of contaminated sites - continuing in remediation and monitoring of environmental burdens at priority sites listed in the Informational System of Environmental Burdens according to the State Remediation Programme of Environmental Burdens (2022–2027).
- Continuing in application of measures according to Rural Development Programme for SR (2014–2020) extended to 2022, when the new Common Agricultural Policy (CAP) enters into force. The measures include the advisory services for agriculture, support for organic farming, managed agricultural and forestry activities in NATURA 2000 areas, etc.
- Research, improvement of knowledge base reducing uncertainty - support of research project, support of purpose monitoring to increase information about groundwater contamination and sources of contamination.
- Strengthening control activities (personnel and financial) including increasing the number of controls.
- Education and training in the field of water protection for the professional and public (including school).

PO - Construction measure planning on-going after the end of 2020
CO - Construction of measure on-going after the end of 2020
SK – Chemical
BM-07 Measures to reduce pollution from urban areas

- **description of the measure:** Construction or upgrades of sewerage systems and wastewater treatment plants according to Plan of Public Sewerage System Development for years 2021 - 2027. Measures for sewerage systems (collecting systems for urban waste water) to comply article 3 of Council Directive 91/271/EEC and measures for urban waste water treatment to comply with article 4 and article 5 of Council Directive 91/271/EEC in ground water bodies.
- **responsible authority:** Ministry of Environment of the Slovak Republic
- **quantitative information by appropriate indicators:** measures for agglomerations >2000 PE: sewerage systems in 5 agglomerations and 3 WWTP need to be (re)constructed or upgraded; measures in DWPA Žitný ostrov for agglomerations <2000 PE: 41 agglomerations sewerage systems and 5 agglomerations sewerage systems and WWTP.

MN - Measure implementation not started by the end of 2020

BM-07								
<ul style="list-style-type: none"> • description of the measure: BM07 • responsible authority: local governments • quantitative information by appropriate indicators (number of measures/projects and costs): HU transposed the Urban Waste Water Directive by Gov. decree 25/2002. (II. 27.) on the National Wastewater Collection and Treatment program. The implementation of UWWD is ongoing. 								
BM-09								
<ul style="list-style-type: none"> • description of the measure: BM09 • responsible authority: authorities for soil protection and for water protection • quantitative information by appropriate indicators (number of measures/projects and costs): HU transposed the ND by the Gov. Decree No. 27/2006. (II.7.) on the protection of waters against pollution caused by nitrates of agricultural sources. Designation of nitrate vulnerable zones was revised in 2013 (NVZ; ~69% of Hungary) . The Code of Good Agricultural Practice (GAP) is obligatory on NVZ's. Outside the NVZ's, the agri environmental measures assist the implementation of GAP on a voluntary basis. 								
HU – Quantity:								
SM: measure for the inland excess water retention								
OBM-23: development of water information system concerning the electronic-authorisation; New regulation on water management elaborated to take action against the installation and use of illegal agricultural water wells.								
PO - Construction measure planning on-going after the end of 2020								
CO - Construction of measure on-going after the end of 2020								
SK – Chemical								
BM-07 Measures to reduce pollution from urban areas								
<ul style="list-style-type: none"> • description of the measure: Construction or upgrades of sewerage systems and wastewater treatment plants according to Plan of Public Sewerage System Development for years 2021–2027. Measures for sewerage systems (collecting systems for urban waste water) to comply article 3 of Council Directive 91/271/EEC and measures for urban waste water treatment to comply with article 4 and article 5 of Council Directive 91/271/EEC in ground water bodies. • responsible authority: Ministry of Environment of the Slovak Republic • quantitative information by appropriate indicators: sewerage networks in 2 agglomerations (>2000 PE) and 1 WWTP need to be (re)constructed or upgraded 								
MN - Measure implementation not started by the end of 2020								
SK – Chemical								
BM-08 Plant protection products								
<ul style="list-style-type: none"> • description of the measure: Continue to meet the requirements arising from the implementation of European Parliament and Council Directive 2009/128/EC concerning the reduction of pesticides pollution from agriculture and implementation 								

of this Directive into national Law and National action programme to achieve sustainable use of pesticides. Continue to apply measure concerning the placing of plant protection products on the market according to Regulation No. 1107/2009 of the EU Parliament and of the Council.

- **responsible authority:** Central Control and Testing Institute in Agriculture, Ministry of Agriculture and Rural Development of the Slovak Republic
- **quantitative information by appropriate indicators:**

BM-09 Nitrates Directive

- **description of the measure:** Continuing in application of requirements of the Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources (Nitrates Directive). The Nitrates Directive requires the fulfilment of the task of the Action Programme, which is established in the SR by Act no. 136/2000 Coll. on fertilizers.
- **responsible authority:** Ministry of Agriculture and Rural Development of the Slovak Republic, Central Control and Testing Institute in Agriculture
- **quantitative information by appropriate indicators:** This measure is applied in groundwater body's vulnerable areas (1293 km²) according to Government Regulation no. 174/2017 Coll. (will be revised in 2021/2022).

SM - Supplementary Measures

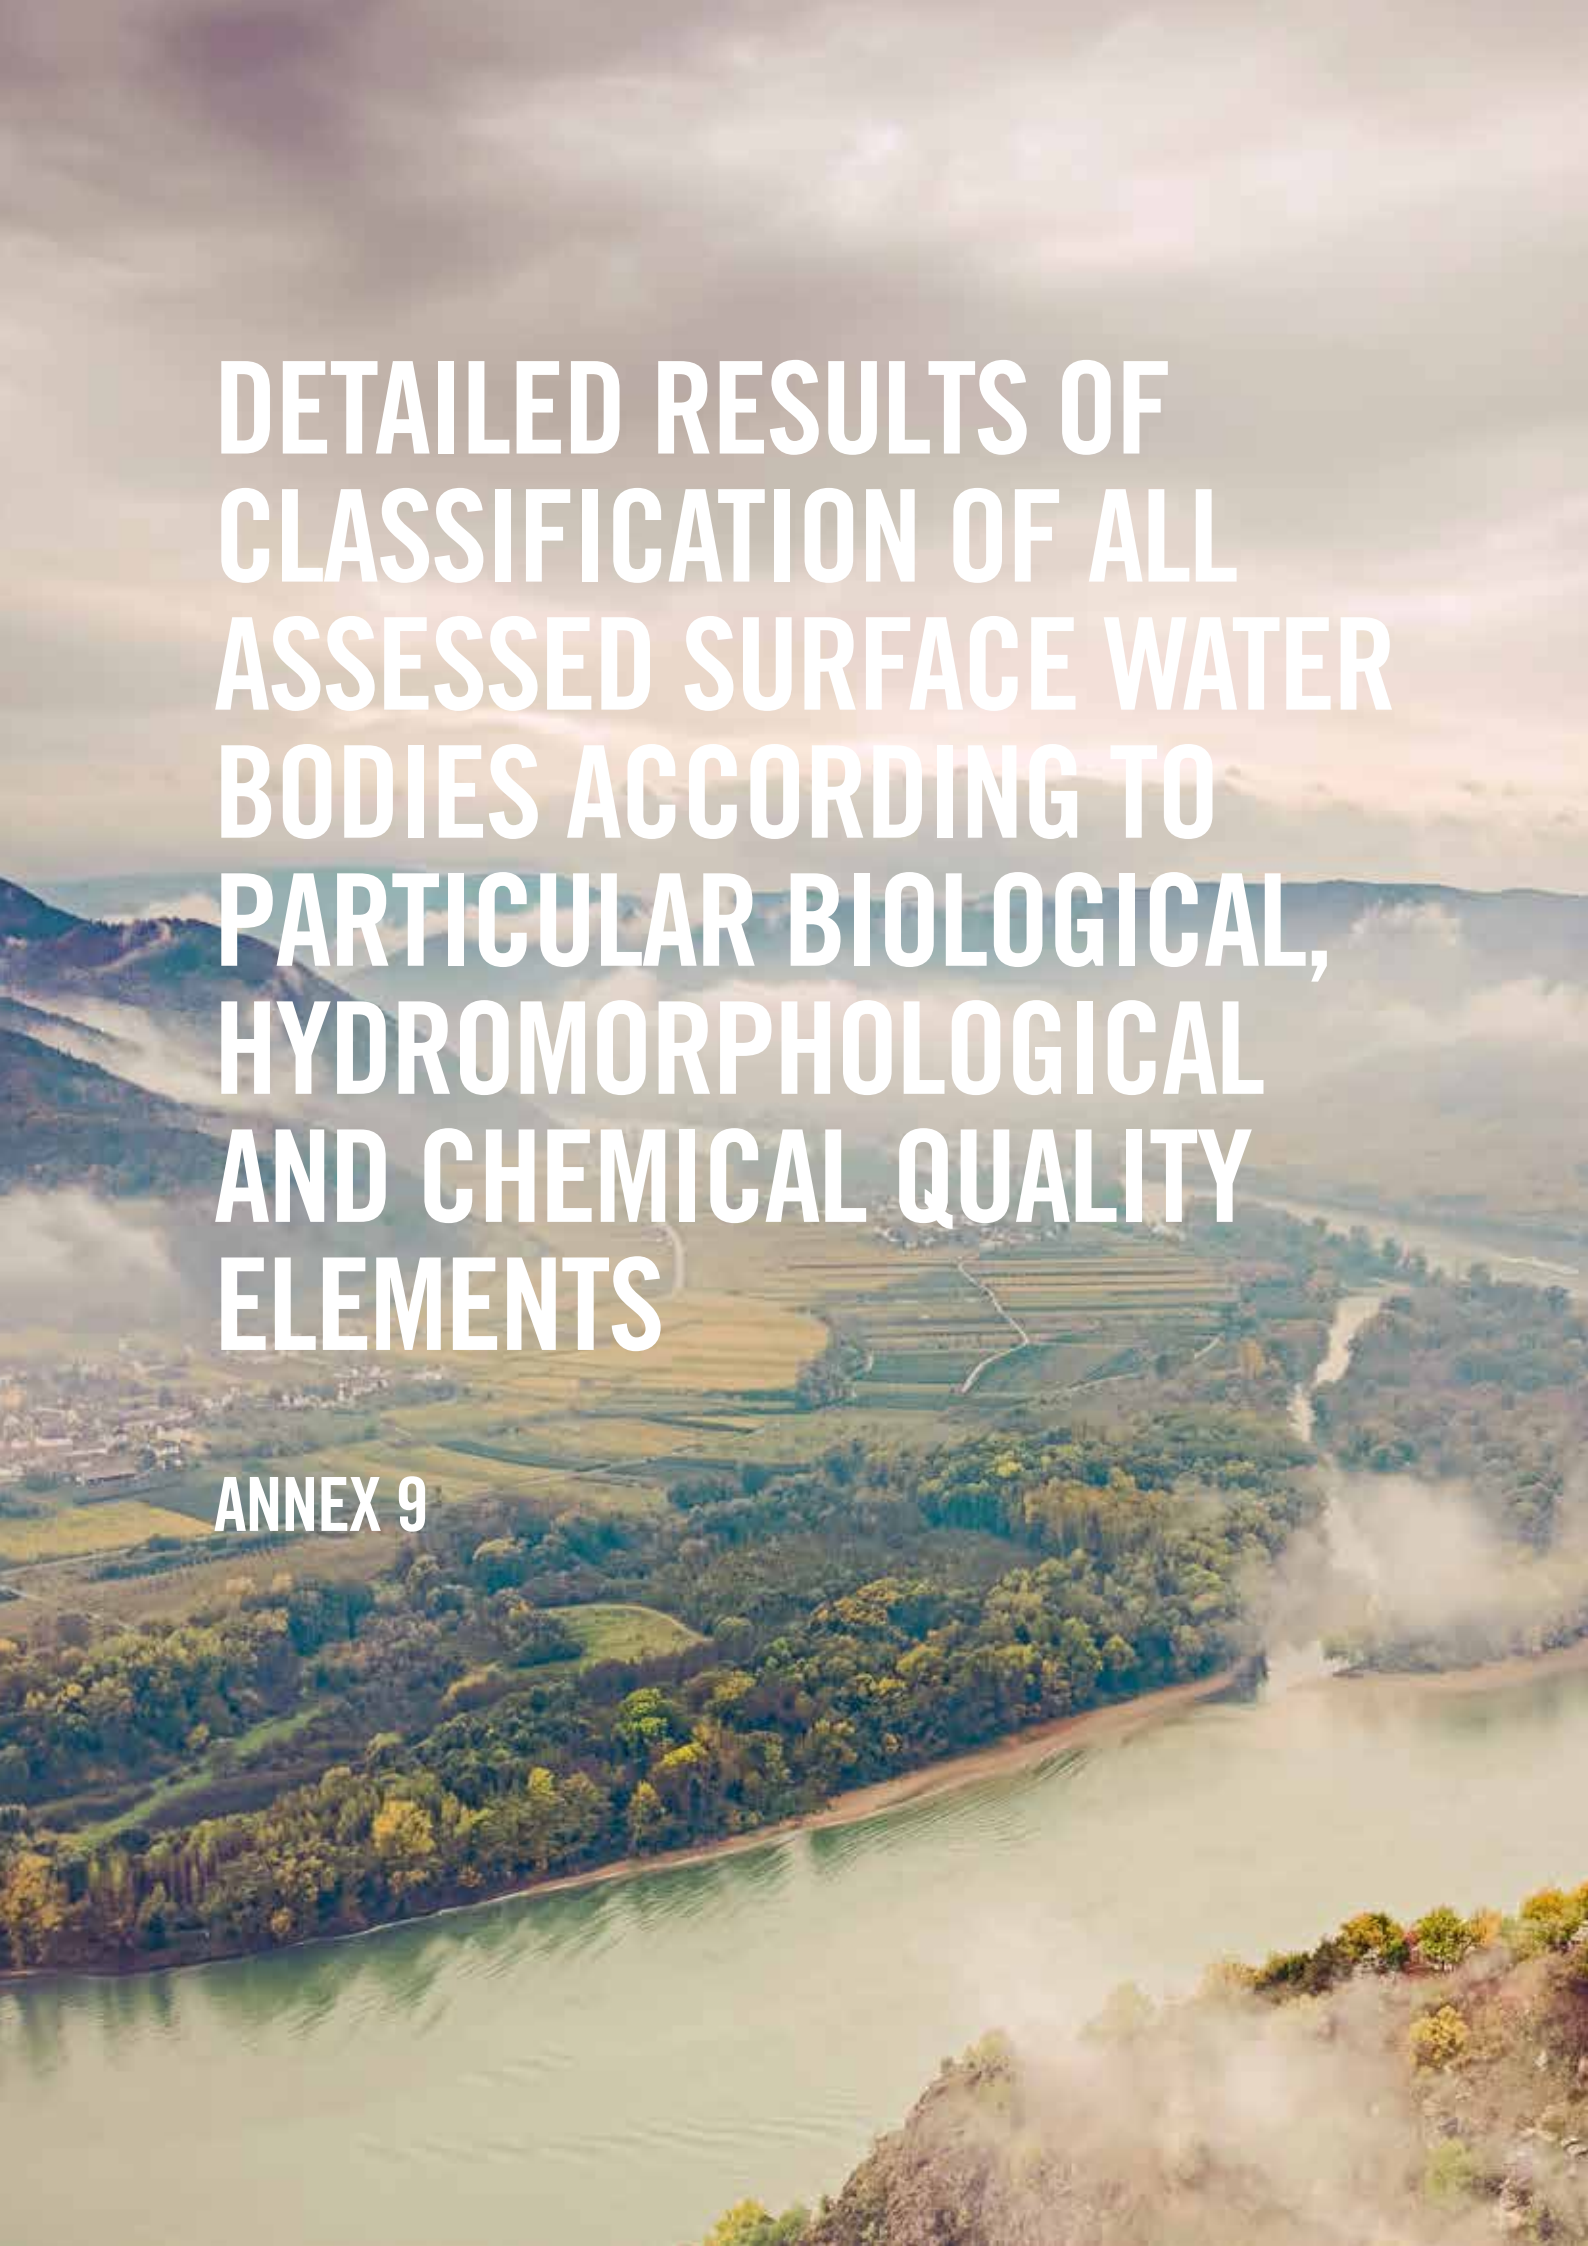

- Remediation of contaminated sites - continuing in remediation and monitoring of environmental burdens at priority sites listed in the Informational System of Environmental Burdens according to the State Remediation Programme of Environmental Burdens (2022 - 2027).
- Continuing in application of measures according to Rural Development Programme for SR (2014 -2020) extended to 2022, when the new Common Agricultural Policy (CAP) enters into force. The measures include the advisory services for agriculture, support for organic farming, managed agricultural and forestry activities in NATURA 2000 areas, etc.
- Research, improvement of knowledge base reducing uncertainty - support of research project, support of purpose monitoring to increase information about groundwater contamination and sources of contamination.
- Strengthening control activities (personnel and financial) including increasing the number of controls.
- Education and training in the field of water protection for the professional and public (including school).

An aerial photograph of a wide river valley. The river flows from the bottom left towards the right. The valley floor is a patchwork of green and yellow agricultural fields, interspersed with dense green forests. In the background, rolling hills and mountains are visible under a cloudy sky. The overall scene is a mix of natural and agricultural landscapes.

DETAILED RESULTS OF CLASSIFICATION OF ALL ASSESSED SURFACE WATER BODIES ACCORDING TO PARTICULAR BIOLOGICAL, HYDROMORPHOLOGICAL AND CHEMICAL QUALITY ELEMENTS

ANNEX 9

Labels in the tables		Description	Possible values
	Water body code	Water body code (including country code)	
	River	Name of river	
	Water body name	Name of water body	
	from river-km	Lower river km of the water body (on Danube River)	
	to river-km	Higher river km of the water body (on Danube River)	
	Water body type	Type of water body	N = natural, A = artificial H = heavily modified P = provisionally identified as heavily modified
Biological Quality Elements	Fish	Status class for the water body	1 = high 2 = good 3 = moderate 4 = poor 5 = bad - = not applicable
	Benthic invertebrates	Status class for the water body	
	Phytobenthos and Macrophytes	Status class for the river or lake water body	
	Angiosperms	Status class for the coastal or transitional water body	
	Macroalgae	Status class for the coastal or transitional water body	
	Phytoplankton	Status class for the water body	
	Overall Biological Status	Status class for the water body = worst case of the status classes of all biological quality elements (acc. to one-out-all-out principle)	
	Hydromorphology - High Status	Only if biological quality elements are in high status, hydromorphology must also be in high status	Y = yes N = no
	General Phys. and Chem. conditions	Status class for the water body for general physical and chemical conditions supportive to the Ecological Status	1 = high 2 = good 3 = moderate 4 = poor 5 = bad
	River Basin Specific Pollutants	Status class for the water body for specific pollutants based on national quality standards; relevant for the assessment of Ecological Status. Specific pollutants are those pollutants that are regulated at the national level (and not included in the List	G = good F = failing
	OVERALL ECOLOGICAL STATUS/POTENTIAL	Worst case of the Biological Quality Class and Specific pollutants Status Class. For High Ecological Status/Potential additionally the General Physical and Chemical Parameters and the Hydromorphology have to be in high status.	1 = high 2 = good 3 = moderate 4 = poor 5 = bad
	Related confidence class	Confidence level of assessment (agreed by the MA EG)	H = high M = medium L = low

CHEMICAL STATUS for priority substances (and confidence)	...in water	Chemical status class for priority substances in water, regulated by the EU	G = good F = failing
	Related confidence class	Confidence level of the assessment of priority substances in water (agreed by the MA EG)	H = high M = medium L = low
	...in water w/o ubiquitous	Chemical status class for priority substances in water, regulated by the EU, without ubiquitous substances according to Directive 2013/39/EU: (i.e., without <i>brominated diphenylethers, polyaromatic hydrocarbons, tributyltin compounds, perfluorooctane sulfonic acid and its derivatives, dioxins and dioxin-like compounds, hexabromocyclododecanes, heptachlor and heptachlor epoxide, mercury</i>)	G = good F = failing
	Related confidence class	Confidence level of the assessment of priority substances in water without ubiquitous substances (agreed by the MA EG)	H = high M = medium L = low
	...in biota	Chemical status class for priority substances in biota, regulated by the EU	G = good F = failing
	Related confidence class	Confidence level of the assessment of priority substances in biota (agreed by the MA EG)	H = high M = medium L = low
	...in biota w/o ubiquitous	Chemical status class for priority substances in biota, regulated by the EU without <i>brominated diphenylethers and mercury</i>	G = good F = failing
	Related confidence class	Confidence level of the assessment of priority substances in biota, regulated by the EU without <i>brominated diphenylethers and mercury</i> (agreed by the MA EG)	H = high M = medium L = low
OVERALL CHEMICAL STATUS	OVERALL CHEMICAL STATUS	Chemical status class for priority substances in water and biota, regulated by the EU	G = good F = failing
	Related confidence Class	Confidence level of the assessment of priority substances in water and biota (agreed by the MA EG)	H = high M = medium L = low
Exemptions	Exemption Art. 4(4)	Usage of exemption according to EU WFD Art. 4(4)	Y = yes N = no - = not applicable
	Exemption Art. 4(5)	Usage of exemption according to EU WFD Art. 4(5)	Y = yes N = no - = not applicable

Status assessment of the Danube river

TRANSBOUNDARY SURFACE WATER BODIES

ANNEX 10

The table provides an overview of the transboundary surface water bodies in the Danube River Basin reported by Danube countries.

Transboundary water bodies are those crossing the border between countries or constituting part of the border between two countries for a certain length. WFD Reporting Guidance 2022 adds that “a water body that is entirely within one Member State but is contiguous with a water body in another country is, for the purposes of this reporting, also considered as a transboundary water body.”

The table was prepared within the frame of the IMGIS and MA Expert Groups of the ICPDR to compare the characteristics of water bodies on common river stretches reported by Danube countries, but did not have the harmonisation of neither delineation nor status assessment as objective. It contributed to discuss any differences and to improve the consistency of all maps related to surface water bodies in the DRBMP Update 2021.

The mandate for harmonisation of the delineation and the status of the transboundary surface water bodies is not within the ICPDR, but with bilateral river commissions, in case they exist, or for other forms of bilateral coordination between the neighbouring countries.

Addressing the recommendations from the European Commission in their Report on the Implementation of the WFD and FD (Second RBMPs and First FRMPs) in 2019 on further coordination of transboundary surface water bodies, this table supports Danube countries in receiving an informative overview of transboundary surface water bodies in the Danube River Basin.

INVENTORY OF PROTECTED AREAS

ANNEX 11

Explanations

This inventory only includes water-relevant protection areas covering an area larger than 500 hectar.

Types:

H = EU Habitat (FFH) Directive

B = EU Bird Protection Directive

O = Others (Non EU MS)

Country	Protected Area code	Name of Protected Area	Type(s)	Area in km ²
AT	AT1110137	Neusiedler See - Nordöstliches Leithagebirge	B,H	570.9
AT	AT1122916	Lafnitztal	H	5.9
AT	AT1126129	Waasen - Hanság	B	30
AT	AT1201A00	Waldviertler Teich-, Heide- und Moorlandschaft	H	137.2
AT	AT1202000	March-Thaya-Auen	H	88.6
AT	AT1202V00	March-Thaya-Auen	B	148.1
AT	AT1204000	Donau-Auen östlich von Wien	H	95
AT	AT1204V00	Donau-Auen östlich von Wien	B	90.9
AT	AT1208A00	Thayatal bei Hardegg	H	44.3
AT	AT1216000	Tullnerfelder Donau-Auen	H	175.3
AT	AT1217A00	Strudengau - Nibelungengau	H	48.2
AT	AT1218000	Machland Süd	H	16.7
AT	AT1219000	Niederösterreichische Alpenvorlandflüsse	H	70.2
AT	AT1220000	Feuchte Ebene - Leithaauen	H	50.8
AT	AT1301000	Nationalpark Donau-Auen (Wiener Teil)	B,H	22.6
AT	AT2101000	Hohe Tauern, Kärnten I	H	415.8
AT	AT2102000	Nockberge	H	79.8
AT	AT2105000	Vellacher Kotschna	H	5.8
AT	AT2108000	Inneres Pöllatal	H	32
AT	AT2109000	Wolayersee und Umgebung	H	19.4
AT	AT2112000	Villacher Alpe (Dobratsch)	B,H	23.3
AT	AT2114000	Obere Drau	B,H	10.3
AT	AT2116000	Görtschacher Moos - Obermoos im Gailtal	B,H	12.4
AT	AT2120000	Schütt - Graselitzen	B,H	23.1
AT	AT2129000	Hohe Tauern, Kärnten II	B	415.8
AT	AT2134000	Mittagskogel - Karawanken Westteil	H	27
AT	AT2160000	Sattnitz-Ost	H	7
AT	AT2161000	Kronhofgraben	H	9
AT	AT2167000	Tscheppaschlucht - Ferlacher Horn	H	5.5
AT	AT2205000	Pürgschachen-Moos und ennsnahe Bereiche zwischen Selzthal und dem Gesäuseeingang	B,H	16.2
AT	AT2208000	Lafnitztal - Neudauer Teiche	B,H	11.8
AT	AT2210000	Ennstaler Alpen/Gesäuse	B,H	145.2
AT	AT2213000	Steirische Grenzmur mit Gamlitzbach und Gnasbach	B,H	21.9
AT	AT2215000	Teile der Eisenerzer Alpen	H	43.9
AT	AT2220000	Zirbitzkogel	B	23.1
AT	AT2225000	Demmerkogel-Südhänge, Wellinggraben mit Sulm-, Saggau- und Laßnitzabschnitten und Pößnitzbach	B,H	21.2
AT	AT2226000	Furtner Teich - Dürnberger-Moor	B	10.7
AT	AT2229000	Teile des Steirischen Jogl- und Wechsellandes	B	454.9
AT	AT2229002	Ennstal zwischen Liezen und Niederstuttern	B	25.6

Country	Protected Area code	Name of Protected Area	Type(s)	Area in km ²
AT	AT2230000	Teile des südoststeirischen Hügellandes inklusive Höll und Grabenlandbäche	B,H	156.6
AT	AT2233000	Raabklamm	B,H	5.6
AT	AT2236000	Ober- und Mittellauf der Mur mit Puxer Auwald, Puxer Wand und Gulsen	H	13.2
AT	AT2243000	Totes Gebirge mit Altausseer See	B,H	239.6
AT	AT3101000	Dachstein	B,H	145.6
AT	AT3105000	Unterer Inn	B,H	8.7
AT	AT3110000	Ettenau	B,H	6.3
AT	AT3111000	Nationalpark Kalkalpen und Umgebung	B,H	221.1
AT	AT3113000	Untere Traun	B	23.1
AT	AT3114000	Traun-Donau-Auen	B,H	6.6
AT	AT3117000	Mond- und Attersee	H	61.3
AT	AT3119000	Auwälder am Unteren Inn	H	5.8
AT	AT3120000	Waldaist und Naarn	H	38.4
AT	AT3121000	Böhmerwald und Mühltäler	H	93.5
AT	AT3122000	Oberes Donau- und Aschachtal	H	71.2
AT	AT3123000	Wiesengebiete und Seen im Alpenvorland	H	12.6
AT	AT3124000	Wiesengebiete im Freiwald	B	24.1
AT	AT3127000	Eferdinger Becken	H	13.4
AT	AT3128000	Bäche in den Steyr- und Ennstaler Voralpen	H	5.1
AT	AT3129000	Wiesengebiete im Mühlviertel	H	5.7
AT	AT3132000	Machland Nord	H	11.4
AT	AT3138000	Schluchtwälder der Steyr- und Ennstaler Voralpen	H	7.7
AT	AT3139000	Unteres Traun- und Almtal	H	12.5
AT	AT3144000	Goiserer Weißenbachtal	H	10.6
AT	AT3209022	Salzachauen, Salzburg	B	11.2
AT	AT3210001	Hohe Tauern, Salzburg	B,H	805
AT	AT3211012	Kalkhochalpen, Salzburg	H	237
AT	AT3223000	Salzachauen, Salzburg	H	7.4
AT	AT3302000	Vilsalpsee	B,H	18.3
AT	AT3303000	Valsertal	B,H	35.2
AT	AT3309000	Tiroler Lech	B,H	41.4
AT	AT3410000	Gadental	H	15.4
AT	AT3412000	Verwall	B	121.1

An aerial photograph of a wide river valley. The river flows from the upper right towards the lower left. The valley floor is a patchwork of green and yellow agricultural fields, interspersed with dense green forests. In the distance, rolling hills and mountains are visible under a cloudy, overcast sky. The overall scene is a mix of natural and agricultural landscapes.

OVERVIEW OF KEY MEASURES TO AVOID THE EXTINCTION OF DANUBE STURGEONS AND NECESSARY SUPPORTIVE ACTIONS

ANNEX 12

Overview of key measures to avoid the extinction of Danube sturgeons and necessary supportive actions

1. Ex situ broodstocks/ Reproduction and release programmes

Given the critically endangered status of the Danube sturgeon species and the high risk of their extinction, even in the short term, it is an urgent priority to establish non-commercial/non-private facilities, both in the Upper/Middle Danube and the Lower Danube, for authentic Danube sturgeon broodstocks to secure the genetic diversity of all sturgeon populations by establishing basin-wide so-called ex-situ programmes following best practice guidelines for husbandry with secure funding for construction and operation and jointly managed by catchment countries. Back-up facilities need to be established to minimise the risk of losing the genetic resources due to technical or other failures. Long term breeding plans need to be established and regular control of husbandry methods have to ensure genetic purity and diversity as well as fitness for survival of juveniles from these facilities.

Reproduction and release programmes must be put in place and implemented following the best practice guidelines and monitored to control the success rate of release actions. The regional coherence of measures has to be secured through basin-wide coordination for all population restoration facilities and monitoring actions

2. Follow-up of the We Pass project

The We Pass project is the first concrete project to identify technical solutions for restoring a major ecological corridor for sturgeon migration in the Danube River Basin across the Iron Gate dams. It aims to provide significant benefits at the scale of the River Basin by creating access to sturgeons from the Black Sea to almost 1000 kms of the Danube and its associated habitats for, inter alia, spawning and nursery purposes. The search for solutions, which will benefit all migratory fish in the Danube, has received significant financial support from the EU. The corresponding activities of the ICPDR and Contracting Parties are fully in line with the European Green Deal and the proposed EU Biodiversity Strategy 2030 with its emphasis on restoring freshwater ecosystems, the natural function of rivers and restoration of rivers into free-flowing rivers. The ICPDR is committed to follow through with implementation of solutions to ensure sturgeon migration across the Iron Gate and to ensure that infrastructure development in the Danube River Basin does not prejudice ecological connectivity in the basin and ensure that, with a view to this, Article 4(7) of the Water Framework Directive is strictly applied.

3. Effectively enforced multi-decadal fishing bans

Restoration of habitats and migration corridors will not be effective unless fishing of sturgeon remains prohibited until viable populations are established. For the Danube this will require a multi-decadal approach. Any exceptional catch allowance e.g. for scientific purposes or the establishment of artificially maintained populations in special facilities must also be monitored closely. The implementation and enforcement of existing legislation to prevent illegal, unregulated and undocumented (IUU) fisheries in marine and freshwater must be strengthened and adequate resources as well as continuous capacity building and targeted training for relevant enforcement authorities need to be provided. The fishing sector must be involved and alternative income sources for affected communities developed.

4. Habitats, Migration Corridors and Controls on Infrastructure Development

Successful sturgeon migration, which is a necessary component of their natural lifecycle, depends on the availability of different habitats along their migration route as well as on their ability to overcome any existing barriers which can prevent their migration. The network of habitats and migration routes must extend to the scale of the Basin in order to be effective. Habitat availability is understood in terms of both location and timing of habitat use as well as the resources and conditions needed to enable this use. Mapping of different sturgeon habitats on the Danube River and its tributaries is highly important. A first basin-wide map was developed in the MEASURES project and will need continuous and coordinated updating, based on the shared set of methods and techniques described in the MEASURES project “Danube Migratory Fish Habitat Manual” to ensure comparability and interoperability throughout the basin. It will enable all countries in the Danube River Basin to coordinate their activities concerning mapping sturgeon habitats, mapping and monitoring of any disturbances by human activities (e.g. dredging, port construction, dams or weirs) and potential restoration measures. Special consideration will have to be given to ensure the full implementation of the requirements of Article 4(7) of the WFD to minimize the impact on sturgeon habitats and migration routes due to changes in hydrology and structure of water bodies, e.g. as a result of new infrastructure or activities in the riverbed. A map of sturgeon habitats could be available as a useful tool when assessing future infrastructure works and enabling environmental impact assessment for particular sectors of the Danube River Basin.

5. Monitoring and control of by-catch in marine fisheries

While there are no records of incidental bycatch of sturgeon in Black Sea fisheries, it is equally clear that given the critical state of stocks and the acute risk of extinction of the remaining sturgeons that bycatch in marine fisheries may threaten the effectiveness of conservation action taken in the Danube River Basin. It will therefore be important for ICPDR and Contracting Parties to seek cooperation with fisheries and environmental authorities in non-Danubian Black Sea States, the Black Sea Commission, FAO (GFCM) and the World Bank/GEF to seek improved information on the extent to which such bycatch is taking place and its impact on sturgeon populations and identify coherent regional management options (such as technical solutions, fisheries restrictions, closed areas and seasons) with a view to their implementation and establishing the appropriate monitoring thereof. Action in this respect will bring the ICPDR into line with the proposed EU Biodiversity Strategy 2030 and its emphasis on eliminating by-catch or reducing it to levels allowing full recovery of species threatened with extinction in marine fisheries.

6. Coordination with sturgeon conservation in the Black Sea Basin

As the Danube sturgeon populations are shared with those of the Black Sea Basin, coordination with marine management and conservation efforts in that basin is crucial to ensure the effectiveness of actions in the Danube River Basin. It is therefore important for the ICPDR and its Contracting Parties to seek actively specific and close cooperation on sturgeon conservation in the Black Sea, inter alia with the Black Sea Commission, FAO (GFCM), the World Bank and GEF as well as Black Sea States on issues such as monitoring of sturgeon populations and the impact of marine fisheries on these, protection of sturgeons through technical fisheries regulation and designation of marine protected areas. Furthermore, it will be important to cooperate with non-Danubian States in the Black Sea Basin on protection and conservation of sturgeon in their internal and inland waters.

The objective of the wider cooperation with Black Sea Basin States and the relevant international organisations should be to ensure a regional coherence of measures and approaches to maximise the effectiveness of policies and measures.

The effectiveness of the actions outlined above is critically dependent on a number of additional, supportive actions that are also required to facilitate effective management of sturgeon conservation in the Danube River Basin. The most important issues are the following:

7. Sturgeon Population Monitoring

The impact of implemented measures for improving sturgeon populations in the Danube River Basin is impossible to monitor without prior knowledge of status of native stocks of sturgeons. Due to the migratory nature of the sturgeon, monitoring needs to be based on agreed common metrics and methodologies, a shared monitoring network and interoperable equipment throughout the Danube River Basin and the adjacent Black Sea catchment. It is necessary to integrate sturgeon monitoring into fisheries management plans in each country and to collect monitoring data on a basin-wide scale. It could include monitoring annual recruitment from the wild and capturing young of the year (YOY) sturgeons, sampling and tagging YOY sturgeons and sampling and telemetry study of adult sturgeons. Telemetry is the most effective monitoring technique and will require standardized equipment throughout the monitoring area. As some scientists from Danubian countries are active in COST Action “The European Aquatic Animal Tracking Network” (ETN) this network could be used as scientific base for the preparation of a sturgeon telemetry study. National fisheries authorities, fishermen and relevant international organisations should be involved to enable effective implementation of sturgeon telemetry study.

8. Establishment and maintenance of a Danube Migratory Fish Database

This will support the implementation of “Strategy for ecological corridor conservation in the Danube catchment” developed under the MEASURES project. The MIS will be used to collect relevant information on migratory fish and their habitats in the Danube River Basin and allow users to find and visualise specific information about particular migratory fish and their habitats more easily. MIS has a Library (open access publications, articles and reports), a meta database (relevant datasets in the region) and a Data Centre (monitoring data of migratory fish including habitats and corridors). It will thus also be a one-stop shop for information for use in management of the recovery of sturgeon populations in the Danube River Basin. Like other such databases, MIS will need to be maintained and regularly updated to retain its utility as a management tool.

ECONOMIC ANALYSIS

ANNEX 13

The economics analysis of the DRBMP Update 2021 is based on a questionnaire sent out to the Danube countries in autumn 2019 and spring 2020, for the collection of qualitative information on economics important in the framework of WFD implementation (e.g. cost recovery, water pricing, environmental and resource costs etc.). The questionnaire presented the data which was included in the DRBMP Update 2015, and asked the countries to update the information.

The tables in this Annex provide the updated information; the corresponding chapter 7 presents an overview of the approaches which are in place in the Danube countries in text form. Data from all countries are included, with the exception of the Republic of Moldova.

Note: Data from Serbia does not include data from the Autonomous Provinces Kosovo and Metohija.

Table 1: Investment costs for water supply and wastewater*

Country	Demand and Supply Costs ¹ [EUR]	Only demand costs [EUR]	Only investment costs (without distinguishing) [EUR]
DE	-	-	Water supply services: 340 million EUR / year (National total in 2017 approx. 2.7 Billion EUR/year) Waste water services: Approx. 610 million EUR/year (National total in 2016 approx. 4.9 Billion EUR)
AT	-	-	3.3 billion (2013 - 2018)
CZ	-	Data not yet available	Data not yet available
SK	-	-	501.41 million EUR** (water supply + wastewater) of which: water supply: 36.52 million, wastewater: 464.89 million
HU***	-	-	Water supply: 59 646 million HUF 192.3 million EUR (2016-2021) Waste water: 300 579 million HUF 959 million EUR (2016-2021)
SI	-	-	Water supply: Investment costs in the period from 2013 to 2018: 816,6 million. EUR Waste water treatment Total investment costs in the period from 2013 to 2018: - for agglomerations above 2.000 PE for collection systems: 424 million. EUR - for UWWTPs with capacity above 2.000 PE (secondary and tertiary treatment): 225 million. EUR
HR	-	-	2,9 billion € for waste water; 335 million € for water supply; (investment Plan 2014-2023 for whole territory of Croatia)
BA	-	1.1 billion	Water supply services: 390.82 million EUR (2016-2021) Waste water services: 705.70 million EUR (2016-2021)

¹ According to the questionnaires: demand cost are the "total costs related to implementing the EU Directives"; supply costs are the investment costs that could be realistically covered.

ME	-	-	Urban Waste Water investment costs are estimated at € 350.4 million to be incurred prior to 2035. Drinking water Investment costs are estimated at € 71 Million to be incurred prior to 2025.
RS	-	-	Total investments for DWD approx. 1.4 billion EUR Total investments for UWWT approx. 4.5 billion EUR
RO			29.411.781 EUR – water supply and waste water infrastructure.
BG	-	883.9 mio. EUR (2016-2021; wastewater collection and treatment) Assessment of the investment costs for the time 2022-2027 is forthcoming task in the frame of RBMP updating process.	-
MD			
UA	-	-	Water supply + wastewater: 13.5 million EUR (DRBD). Capital investments for environmental protection expenditures on return water treatment – 0.25 million EUR (DRBD)

*Timescales: 2015-2021, if not noted otherwise.

** (SK): Data for the whole country (Danube part represents 96.23 % of the total territory of Slovakia) and for 2014-2020.

*** (HU): Drinking water supply includes both the protection of national water resources and the implementation of a drinking water quality improvement program. The public wastewater collection and treatment also includes sewerage, wastewater treatment (below and above 2000 PE) and sewage sludge treatment. The costs were planned on the basis of the relevant EU programs, so do not include reconstructions, only direct compliance with the EU Directives. (The applied EUR/HUF exchange rate for the period of the 2nd RBMP is 310.1)

Table 2: What are water services - what are water uses?

Country	Only water supply and wastewater	Water supply, wastewater AND others	Included in cost recovery calculations (Y/N/Partly)	Other definitions	Is the definition of water services included in the national water legislation (Y/N)
DE	✓		Y		Y
AT		✓	Y (based on estimation)		Y (Water services to which Article 9 par 1 second indent WFD is applied are defined. Other water services are regulated in the frame of water uses)
CZ		✓ Rivers and river basin management; surface water abstraction; GW abstraction; discharge of wastewater into surface water; discharge of wastewater into GW; impoundment for the energy production; navigation – only recreation	Y		Y (§ 2 let. a) of Decree No. 24/2011 Coll.) - Any activity which provides for abstraction, retention, collection, treatment and distribution of surface water or GW, or the removal and treatment of waste water with subsequent discharge into surface water, for households, public institutions or any economic activity
SK		✓ Use of hydro-energy potential of water-course; abstraction of energy water from watercourse; abstraction of surface water from water-course	Y (water supply, wastewater, use of hydroenergy potential, abstraction of energy water, abstraction of surface water)	Navigation is defined as a "public service - paid by the state"	Y
HU		✓ Public water supply, public wastewater collection and treatment,	Y	✓ (the other different water uses are taken into consideration as "water uses"	Y

		agricultural water supply (irrigation, fishponds, other), damming and storage for hydropower production, own water abstraction		(according to WFD Article 2 Definition 39))	
SI		✓	Partly		Y
HR	✓		Y	<p>Additional definition of water activities has been enacted.</p> <p>Water activities are all activities that provide for households, public institutions or economic entities:</p> <p>a) abstraction, impoundment, storage, treatment and distribution of surface or groundwater, and</p> <p>b) collection and treatment of wastewater, subsequently discharged into the water. Water activities include but they are not limited to water services.</p> <p>CR calculation includes all water activities.</p>	Y
BA		✓ 13 other water services defined	N		
ME	✓	-	-	-	✓
RS			N		<p>N</p> <p>There is no definition of water services in WL, but WL sets the charges/fees for water abstraction and waste water disposal for different purposes (water use: public water supply, irrigation, industries,</p>

					hydropower, bottling, etc., and waste water disposal: municipal, industrial, cooling, etc.), sediment abstraction, etc.
RO		✓ Contributions for using water resource for hydropower, thermal plants, nuclear power plant for aquaculture, irrigation, industry, households. Structured on type of water resource (surface and groundwater).	Y		Yes (Water Law)
BG	-	-	Y All costs considered (financial, environmental and resource costs)	✓ Public water supply; public collection of waste water; public treatment of wastewater; individual water supply in industry; individual water supply in agriculture for irrigation; individual water supply for stockbreeding; producing of electric power by water electric plant; protection of harmful impact of water; conservation of water; navigation and other activities connected with navigation; individual drinking water supply	Y
MD	n.a.				
UA	-	Water supply, wastewater collection and treatment; agricultural; fish farming; surface water abstraction;	Y	Water use - the use of water (water bodies) to meet the needs of the population, industry, agriculture,	Y Water Code

		use of hydro-energy potential.		transport and other sectors of the economy, including the right to water intake, wastewater discharge and other uses of water (water bodies).	
--	--	--------------------------------	--	---	--

Table 3: Water pricing policies in place, and prices of water services/uses

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
DE	Water supply	ERC are considered in the recovery of the costs of water supply services (EUR/m ³); they are not quantified individually		ERC are considered in the recovery of the costs of water supply services (EUR/m ³); they are not quantified individually	
	Waste water treatment	ERC are considered in the recovery of the costs of waste water services; they are not quantified individually		ERC are considered in the recovery of the costs of waste water services; they are not quantified individually	
AT	Water supply	ERC are internalized in the price for drinking water (EUR/m ³) but they are not yet quantified individually		Payments for ERC are internalized in the price for drinking water (EUR/m ³) but they are not yet quantified individually	
	Waste water treatment	ERC are internalized in the price for wastewater treatment (EUR/m ³) but they are not yet quantified individually		Payments for ERC are internalized in the price for wastewater treatment (EUR/m ³) but they are not yet quantified individually	
	Others (e.g. hydropower for electricity production, navigation, aquaculture)	ERC are internalized in environmental requirements but they are not yet quantified individually		Payments are internalized in environmental requirements but they are not yet quantified individually	
CZ	Drinking water supply	ERC costs in the form of charges for groundwater and surface water abstraction is internalized in the price for drinking water (EUR/m ³)		No separate payment exists. ERC recovery costs are internalized.	
	Wastewater treatment	ERC are in the form of charges for pollution and volume of discharged wastewater.		See the answer above.	
	Water storage and impoundment for energy production	ERC costs in the form of charges for impoundments are internalized in the price which is agreed between the customer and State Enterprises of River Basin Management(EUR/m ³)		No separate payment exists. ERC recovery costs are internalized.	
	Navigation	Not assessed	Not assessed	No payment	No payment
SK	Water supply for households, industry and agriculture	Not assessed	Resource cost in the form of charges for groundwater abstraction as well as payments for surface water abstraction is internalized in the price for drinking water (EUR/m ³)	No payment	No separate payment, only the internalized one
	Collection and treatment of wastewater	Environmental cost in the form of charges for discharge of wastewater is internalized in the price for the collection and treatment of wastewater (EUR/m ³)	Not assessed	No separate payment, only the internalized one	No payment

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
	Use of hydro-energy- potential of watercourse	Not assessed	Not assessed	No payment	No payment
	Abstraction of energy water from watercourse	Not assessed	Not assessed	No payment	No payment
	Abstraction of surface water from watercourse	Not assessed	Not assessed	No payment	The payment for surface water abstraction is determined in EUR/m ³ and is a component of the price for drinking water. This payment is considered as covering a part of resource costs.
HU	Public wastewater collection and treatment	EC were assessed in 2006-2007 based on the 2005 data. EC are partly internalized in the water load fee and wastewater fine and this is covered by the water price.	Not assessed	Unit water load fee (WLF) in average (depends on different loads) WLF: 4.4 HUF/m ³ (2018) Wastewater fine: 519.9 million HUF (2018) In the case of a wastewater fine, it does not make sense to calculate a specific m ³ for all wastewater volumes, because only a part of it is fined.	No payment Up to RBMP2, the water resource fee (WRF) could only been considered as an environmental cost, but since the WRF rate for water bodies in poor status differs from the others (20% higher), it can also be considered as a partial resource cost.
	Public water supply	EC were assessed in 2006-2007 based on the 2005 data. EC are partly internalised in the water resource fee and this is covered by the water price	Not assessed	2018 water resource fee (WRF) data: 4.42 HUF/m ³	No payment
	Own water abstraction	EC are partly internalized in water resource fee	Not assessed	2018 water resource fee (WRF) data: Industry and other economic sector: 2.43 HUF/m ³ Agriculture: 1.1 HUF/m ³ Others: 11.9 HUF/m ³	Water resource fee is partially serves as resource cost
	Agricultural water supply (irrigation, fishponds, other)	EC are partly internalized in water resource fee	Not assessed	2018 water resource fee (WRF) data:	Water resource fee is partially serves as resource cost

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
				Irrigation: 1.15 HUF/m ³ Fish pond: 0.045 HUF/m ³ Rice production: 0.044 HUF/m ³ Animal husbandry: 13.24 HUF/m ³	
	Damming and storage for hydropower production	EC are partly internalized in water resource fee	Not assessed	2018 water resource fee (WRF) data: In situ water use: 0.0045 HUF/m ³	Water resource fee is partially serves as resource cost
SI	Water supply	ERC are included in the price of drinking water supply service and waste water collection and treatment service. Additional assessments are in progress.		ERC are included in the price of drinking water supply service and waste water collection and treatment service. Additional assessments are in progress.	
	Waste water treatment				
HR	Water Services				
	Water supply	0,40 EUR/m ³ - an estimation based on annual Financial Plan of Croatian Waters		water abstraction fee - 0,38 EUR/m ³	
	Waste water collection and treatment	0.22 EUR/m ³ - an estimation based on annual Financial Plan of Croatian Waters		water pollution charge - 0,18 EUR/m ³ (subject to load coefficients for industrial waters discharge)	
	Other Water Services				
	Abstraction of surface water (excluding water supply and specified activities below)	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 0,11, 0,09, 0,07 and 0,04 EUR/m ³ depending on water status (very good, good, moderate, bad and very bad)	
	Abstraction of groundwater (excluding water supply and specified activities below)	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 0,11 and 0,04 EUR/m ³ depending on water status (good or bad) and 0,15 EUR/m ³ for mineral, thermomineral and thermal waters	
	Water power for electricity production	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 7.5% (for plants over 5 MW) or 5% (for plants up to 5MW) of the average price per 1 kWh electricity produced	

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
	Water power for plant operation (other than electricity production)	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 0,26 EUR per 1 kWh of total installed capacity of the plant	
	Heating and cooling of households and offices	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 0,013 EUR/m ³	
	Rafting and canoeing (as business activities)	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 6,57 EUR/yr per passenger seat	
	Anchoring floating vessels for catering and similar businesses	not assessed (only internalized part was assessed, additional assessments are in progress)		water abstraction charge - 13,14 EUR/yr per m ² of water surface occupied	
	Irrigation	not assessed (only internalized part was assessed, additional assessments are in progress)		65,68 EUR/yr per ha - if the quantity is not measured, if it is measured - the tariffs for surface water and groundwater abstraction apply	
	Water discharges (other than through public wastewater facilities)	not assessed (only internalized part was assessed, additional assessments are in progress)		water pollution charge (i) 0,18 EUR/m ³ of water discharged (subject to load coefficients for industrial waters discharge), (ii) 0,000177 EUR/m ³ of cooling water discharged and (iii) 0.000486 EUR/kg of nitrogen as active substance in mineral fertilizer	
BA	Public water supply	-	-	-	0.005 Euro/ m ³ of abstracted water
	Bottling of water & mineral water	-	-	-	1.00 Euro/ m ³ of abstracted water
	Water supply to industry and others (abstraction)	-	-	-	0.01/0.015 Euro/m ³ (RS/FBiH)
	Irrigation (abstraction)	-	-	-	0.001 Euro/m ³ (RS)
	Fish farming (abstract)	-	-	-	0.0005 Euro/m ³ (RS only) abstr. water
	Fish farming (pollution)	-	-	0.01/0.025 (RS/FBiH) Euro/kg produc. fish	-

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
	Electricity production	-	-	0.0005 Euro/kWh of produced electricity	-
	Wastewater discharge	-	-	1.00 Euro/PE	-
	Pollution caused by vehicles	-	-	1.00 Euro/PE	-
	Pollution caused by use of artificial fertilizer	-	-	0.0025 Euro/kg prod. / imported fertilizer	-
	Pollution caused by use of pesticides	-	-	0.04 Euro/kg of prod. / imported pesticides	-
	Sediment extraction	-	-	0.75 Euro/m ³ of the extracted material	-
	General water charge	-	-	0.5% of the net salary (FBiH only)	0.5% of the net salary (FBiH only)
ME	For drinking and community water supply	-	-	-	0,015€/m ³ delivered water
	For operational and technological needs 0.02 € / m ³ of used water;	-	-	-	0.02 € / m ³ of used water
	for irrigation	-	-	-	0.004 € / m ³ of affected water;
	for bottling or packaging of mineral and natural waters	-	-	-	0,003 € / 1 bottled or packaged water
	for tanking of vessels	-	-	-	0.02 € / m ³ of tanked water
	for drainage or delivery of water for commercial purposes	-	-	-	0.03 € / m ³ of delivered water;
	for growing fish, crabs, shellfish and other seafood	-	--	-	0.01 € / kg of sea bream or sea bass produced 0.005€ / kg of trout produced 0,0075 € / kg of other fish species

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
					€ 0.0025 / kg of shellfish produced 0.01 € / kg of produced crustaceans and other seafood
	for electricity generation at the power plant threshold; for the use of water in extremely favorable natural conditions using hydro- accumulations; for other propulsion purposes	-	-	-	0,0001 €/kWh 0,0006 €/m ³ 0,00005 €/kW
	for rafting	-	-	-	0.5 € per person for one descent.
RS	Fee for water use (public utilities), population	-	-	-	Extracted amount 0.002
	Fee for water use (public utilities), legal entities	-	-	-	Extracted amount 0.004

	Wastewater treatment	ERC are in the form of charges for pollution and volume of discharged wastewater.			

Country	Water service	Environmental cost [EUR/m ³ , EUR/?, not assessed]	Resource cost [EUR/m ³ , EUR/?, not assessed]	Payment for environmental cost recovery [EUR/m ³ , no payment]	Payment for resource cost recovery [EUR/m ³ , no payment]
	Drinking water supply	ERC costs in the form of charges for groundwater and surface water abstraction is internalized in the price for drinking water		ERC are in the form of charges for pollution and volume of discharged wastewater.	Cost recovery through fees for issue of permits 1,74 €/m ³ – surface water 2,02 €/m ³ – ground water
	Producing of electric power by water electric plant		ERC are in the form of charges for pollution and volume of discharged wastewater.		Cost recovery through fees for issue of permits 0,36 €/10 ths m ³ – surface water
	Fish farming		ERC are in the form of charges for pollution and volume of discharged wastewater.		Cost recovery through fees for issue of permits 1,87 €/10 ths m ³ – surface water 2,24 €/10 ths m ³ – ground water

Table 4: Use and calculation of ERC

Country	ERC estimations available [Y/N/partly]	Clear Methodology for calculating ERC [Y/N/partly]	Clear Methodology for cross subsidies [Y/N/partly]
DE	N	Partly - Issue of operationalizing the concept of ERC remains challenging.	N
AT	Partly The internalized parts of EC in AT are estimated through the quantified costs of measures.	Partly (expert judgment involved)	Y According to the polluter pays principle, water users pay the environmental costs they cause in form of water charges as well as implementation of technical measures in order to prevent cross subsidies.
CZ	Y	Partly The calculation of EC in CZ is based on the costs of renewal and saved costs. It determines the costs that would be necessary for compensation of impacts of water management services on environment, respectively for the compensation of the impacts disturbing the state of surface and GW from the quantitative, qualitative and hydromorphological point of view.	N (Subsidies do not play a role in CZ)
SK	N No "full estimations of ERC for single water services"; only the "internalized parts are quantified" ² .	Partly For the estimation of EC, the cost-based approach is used which involves the costs for certain groups of measures. The evaluation of RC is also based on a cost-based approach (e.g. construction of long-distance pipelines to areas failing to achieve good quantitative status of GWBs). As there have not been applied regulatory measures and restrictions, the RC which appear due to non-coverage of water requirements of specific sectors (foregone costs approach) is not yet actual.	Partly (subsidies play little role)
HU	Partly EC are partly quantified, only the internalized parts are quantified. EC were assessed in 2006-2007 based on the 2005 data for waste water and drinking water. Taking the international experience into account we chose the cost-based approach, so we consider the cost	Y EC calculation methodology is clear (cost-based methodology), but the cost of measures is missing. The Water Load Fee (WLF) and water resource fee is internalized of (a part of the) external environmental costs. The rate of the water load fee is defined by the product of: 1) the total	Y There are subsidies for covering a part of the financial cost for households when the service costs are extremely high, the cost are above a certain threshold.

² The share of the charges for the discharge of wastewater into the water courses on the total costs of water companies in providing of wastewater services (i.e. wastewater collection and treatment) is ca. 1,69 % (2018) – these charges are considered as environmental costs. Charges for groundwater abstraction and payments for surface water abstraction are considered as a part of the resource costs (which are paid by those who have the permission to use the water source). The share of these charges and payments for the abstraction on the total costs of water companies in providing of water supply service is about 17,96 % (2018). However, the abstraction of water could be also seen as a form of the environmental costs (because an abstraction represents one of the biggest pressures on water body)...The charges for discharge of wastewater do not represent full estimation of environmental costs. These charges are stipulated by the Decree of the Government and represent only a part (approximately 30%) of the real costs necessary for the wastewater treatment in the wastewater treatment plants.

Country	ERC estimations available [Y/N/partly]	Clear Methodology for calculating ERC [Y/N/partly]	Clear Methodology for cross subsidies [Y/N/partly]
	of the remaining measures needed in order to achieve "good status" as EC.	amount of the annual discharge of the contaminant measured in kilograms, 2) multiplied by a specific rate per pollutant, 3) a measure of area sensitivity and 4) sludge disposal factors. Water resource fee (abstraction fee) is depend on the water resource type and water uses (and some another element). New development: there is a new so called "overload factor" in the calculation, which depends on the quantitative status of each water body. In general, all water users have to pay the water resource fee (WRF) for the amount of water used. The paid amount is received by the state budget.	
SI	Partly	Partly (methodology for calculating ERC is in progress)	N
HR	Partly ERC are partly quantified, only the internalized parts are quantified.	Partly (cost-based approach) Assessment of ERC is ongoing.	N
BA	Partly ERC are partly quantified, only the internalized parts are quantified.	Partly (cost-based approach and expert judgment)	N
ME	Y	N	N
RS	N No "full estimations of ERC for each water service", but parts are included in charges/fees.	Partly (cost-based approach)	N
RO	Partly ERC are partly quantified, only the internalized parts are quantified.	Partly (cost-based approach) A revise of the assessment is ongoing.	No cross subsidy between different water uses is legally provided.
BG	Y ERC are quantified (2008-2012)	Y (Methodology is developed)	N
MD			
UA		Partly (cost-based approach)

Ukraine	n.a.			

*Bulgaria: The lack of CEA for selection of measures in the RBMP 2015-2021 was identified as gap in the previous cycle. In the update of the economic analysis, the implementation of a CEA is included.

**Hungary: Hungary undertook a cost-effectiveness analysis for the first Programme of Measures, but this was not carried out at a water body level. Hungary clarified subsequently that cost effectiveness analysis (CEA) was not carried out in the second cycle because the measures did not change substantially and noted that a general description of the method of prioritisation could be found in chapter 7.2 of the RBMP2.

This question is also a reporting requirement according to the EC WFD Reporting Guidance 2022 (Version: FINAL DRAFT V4, dated 30-04-2020).

Table 8: Use of Disproportionality of Costs in the Danube countries

Slovakia

Agriculture:

Main objectives and priorities of the agricultural policy for the next period include: *sustainability of Slovak agriculture, food self-sufficiency and development and implementation of strategic plan*. However, the relevant documents currently being prepared by the management of the agricultural sector, linked to the CAP, will not be ready until next year (2021). Based on all previous knowledge optimal solutions should be applied.

The agro-sector identified *increasing the food self-sufficiency of Slovakia* as the main priority and committed itself to *developing a long-term strategy for agriculture and the food industry*. (In May 2020, the European Commission presented two key strategies that will have a major impact on the agricultural sector: the Biodiversity Strategy to 2030 and the Farm-to-Table Strategy).

The goal is also changes in payment settings - e.g. not to support only the area itself, but producers of specific foods, i.e. to support production and farmers who want to contribute to the food basket (without division into small and large farmers). The aim is to link financial support from the 1st and 2nd pillars of the CAP to specific production. E.g. the 1st pillar itself has three parts: area payments, eco-schemas and the tying of money to production (coupled payments). Eco-schemas settings are also important, as they can also be linked to production. Tying money to production is a way to recover Slovak agriculture, while coupled payments need to be increased from Eurofunds, but own state participation is also necessary to increase the current low percentage of self-sufficiency (approximately 40%). It is desirable to achieve self-sufficiency, especially in basic commodities (poultry and pork, fruits, vegetables, potatoes), so the priority is to support special animal and plant production. There are also measures to support food production in Slovakia in the government's program statement, for which financial support is necessary (approximately EUR 1 billion must be invested in food production in the next five to seven years). It should be supported that the domestic food industry processes all raw materials grown and bred in Slovakia, as financial support for food processing has been underestimated in previous years. All major steps to increase and achieve food self-sufficiency should be included in *The Strategic Plan* and the so-called *Intervention Strategy*.

Industry:

General statement: Slovak industry is currently not doing well (as in Germany; there is a great link between Slovak industry and Germany - for Slovakia, Germany is the largest trading partner).

The automotive industry has a decisive influence on the Slovak industry.

According to Ministry of Finance's February 2020 macroeconomic forecast, the Slovak economy under foreign influence continued to perform at a slower pace, but was still progressing. Cooling is particularly noticeable in the export-oriented industry. After reaching its peak in 2018, the Slovak economy slowed significantly in 2019 to an estimated 2.3% (Ministry of Finance's forecast, February 2020). The unfavorable development of foreign demand was predominantly reflected in the Slovak export-oriented industry. The February forecast projected a continuation of the economic slowdown in 2020 with GDP growth of 2.2% and expected to support exports through new production at Jaguar Land Rover, whose dynamics were expected to be dampened by weaker external demand.

According to Statistical Office of the Slovak Republic industrial production in April 2020 reached an all-time low since the establishment of the independent Slovak Republic, falling by 42 percent year on year. The decrease was mainly due to a sharp drop in the production of means of transport by 78.9 percent. This situation was significantly affected by the stop or restriction of production at four Slovak car manufacturers, as well as production restrictions at subcontractors throughout the automotive industry, which responded to the measures taken against the spread of COVID-19 in Europe.

According to Eurostat, in May 2020, in a year-on-year comparison, Slovakia recorded the sharpest drop in industrial production within the EU countries, by 33.5 percent.

However, it should be noted that at present all car manufacturers have already carried out a partial resumption or are trying to fully resume production.

Due to the occurrence of the second wave of the pandemic, it is currently not possible to estimate future developments regarding the sector's performance.

The document "Low Carbon Strategy of Slovakia" was approved by the Slovak Government. This Strategy will include effective and cost-effective measures in the sectors of industry, energy, energy efficiency, transport, agriculture and forestry and waste management. The Strategy is a cross-cutting document across all sectors of the economy, which must pursue individual policies so as to complement each other towards the common goal of completely decarbonising Slovakia by 2050.

Energy:

With an estimated 1.23% year-on-year growth, electricity consumption in Slovakia will reach 36.4 TWh in 2030. In terms of electricity demand coverage, the focus will be on the completion of Units 3 and 4 of the Mochovce Nuclear Power Plant (2x471 MW). As mentioned above, by putting these units into operation, the balance between production and consumption of electricity in the ES SR should be changed to export. The export balance of Slovakia should be maintained even after the termination of operation of the Nováky thermal power plant (2x110 MW) in 2023 due to the termination of support for electricity production from domestic coal.

Bosnia and Herzegovina

By increase in capacity of the urban waste water treatment through construction and reconstruction of the WWTPs the water quality should be positively affected.

Also in Bosnia and Herzegovina there is in strategic document planned to increase development of hydropower –electricity production and it is planned till 2021 to grow agricultural sector.

Germany

No new analysis of future anthropogenic developments was performed for the period until 2027 as the analysis for the period 2015-2021 remains broadly valid. The development of the different sectors remains widely interconnected though economic growth and use of resources, like water, are decoupled in an economy largely based on the provision of services. Even though interactions clearly exist, changes of economic parameters don't necessarily induce direct changes of ecologic parameters, e.g. concerning the use of water resources and the hydrological balance.

Overall, the pressure situation due to the observable trends in anthropogenic activities in the considered timeframe can be expected to remain on the current level. More detailed information on the driving forces affecting pressures on water bodies and, consequently potentially affecting water status as well as updated figures on the provision of water services, can be obtained in the River Basin Management Plan for the German share of the Danube Basin.

Austria

Agriculture

Owing to the studied indicators of potential water pollution (livestock or landuse) and accordingly to the prognosis of the Austrian Institute of economic research (WIFO) in the background document for the Economic Analysis 2019 the following things are predicted till 2030:

- in regions with favourable conditions for the expansion of milk production a slight increase of the application of organic fertilizer will take place;
- an overall slight decrease of the agricultural area will happen;
- the reason for regional differences in the river basins of Rhine and Danube will be led back to structural facts in these regions.

The reason for the expected increase in beef production results from the increase of milk production. The impact of climate change could enhance an intensification in the coming decades. However, the agri-environmental program and conditions of the 1st pillar of the CAP weaken these trends.

Industry, Production of goods

Given the observed development of water intensity and the expected production growth, it should be expected, that industrial water consumption will slightly decline until 2030.

It is assumed that the amount of waste water will continue to develop in line with water use; a moderate reduction of amount of waste water is to be expected in the period to 2030.

Electricity generation

The electricity generation by hydro power (excluding Pumped storage power plants) will increase till 2025 by an annual average of 0.9% from 132 PJ (2010) to 152 PJ. The share of hydropower (excluding Pumped storage power plants) in domestic generation falls during this period from 54% to 52%. The share of fossil fuel power decreases from almost a quarter to 17%. The share of electricity produced from renewable energy sources (wind, photovoltaic, biomass) increases from 7% to almost 15%.

Due to WFD requirements it was assumed that production losses in small hydropower and run-of-river power (> 10 MW) occur from 2011 and increase linearly until 2027. The losses in storage power plants on the other hand will be limited until 2027. Furthermore, it was assumed that at the same time the existing potential for plant optimization for existing small hydro- and run-of-river power plants is used. Thus, the (2005) calculated losses are largely compensated.

Czech Republic

Water abstraction and waste water discharge for/from agriculture and industry in the Czech Republic are not expected to increase and the likely scenario (in abstraction and discharge) for the two sectors is stagnation. On the other hand, water abstraction and waste water discharge are expected to increase in case of households. Number of inhabitants supplied with water from water supply systems and inhabitants connected to sewerage systems and WWTPs is also expected to increase. Water quality should be positively affected by construction and improvements of WWTPs.

Romania

The trend of water demand for all water users has been assessed having in view the 2030-time horizon (with 2011 as the reference year). A specific methodology has been developed as basis for the 2nd and 3rd RBMPs.

The methodology comprises of prognosis methods of water demand for population, industry, aquaculture, livestock farms, animal breeding and irrigation. It is based on 3 scenarios (base scenario-medium, minimal and optimistic scenario):

The prognosis of water demand for population considered the population trend at national/county/local level. The prognosis of water demand for irrigation considered the abstraction water for irrigation based on future irrigated area and irrigation specific values according to the type of crops. The prognosis of water demand for livestock considered the water demand based on different livestock specific values of water consumption. The prognosis of water demand for aquaculture considered the related aquaculture surface and related volume.

Trends values Medium Scenario:

- Total demand: 12300 mil. cm;
- Population: 2100 mil. cm;
- Industry: 7400 mil. cm;
- Irrigation: 1700 mil. cm.

Trends values Optimistic Scenario:

- Total demand: 15500 mil. cm (an increase of 26% compared to the medium scenario trend);
- Industry: increase of 34% compared to the medium scenario;
- Irrigation: increase of 25% compared to the medium scenario;
- For population, livestock and aquaculture the optimistic scenario indicates a relatively stable demand compared to the medium scenario.

Hungary

Agriculture: By the Governmental Decision 1335/2017 (VI. 9.), the Government approved Hungary's Food Economics Concept for 2017–2050.

With 5.4 million hectares of agricultural land and 2 million hectares of forest, Hungary has a food production potential that is far from being exploited. According to professional estimates, the Hungarian food economy has a 60% higher production potential by more efficient organization of domestic production and the market, by increasing processing and by purposefully responding to the solvent demand in the world. Hungary's strategic goal is a competitive, economically, environmentally and

socially sustainable food economy, which actively contributes to the development of the national economy and the growth of jobs in rural areas through the continuous growth of its performance and added value, guarantees the country's secure food supply and maintains GMOs. -protect our natural values, preserve biodiversity, protect the environment and manage natural resources in a sustainable way. In the course of its development, agriculture must preserve the natural values of our landscapes, the fertility of the soil, the purity of water resources, protect forests and other important ecosystems, and maintain the ecological balance. Increased state involvement and intervention are needed in the management and conservation of key scarce natural resources, such as land and water.

In the case of consistent adherence to the directions formulated in the Concept and the implementation of the set tasks, there is a reasonable expectation that in 2050 the added value of agribusiness sector within the national economy will reach 25%.

According to the Concept, the conditions for efficient agricultural irrigation must be created in Hungary, thus increasing the proportion of irrigable areas, partly by reducing the damage related to water scarcity, partly by the safety of growing water-intensive, high value-added crops (seeds, field vegetables, fruits) and for more efficient farming in areas with good and medium production conditions but often exposed to droughts. In addition to the water demand of the given crop type, the water demand of agriculture is determined by the size of the area to be irrigated and the development of the irrigation infrastructure.

According to the Concept, farmers can reduce the negative effects of climate change to the crop production by improving soil water management, soil-friendly farming, selecting the appropriate form of land use according to the current condition of the site, using water-saving and soil-retaining cultivation methods and by using micro-irrigation at a higher rate. In animal husbandry, the same goal can be achieved by developing husbandry technology.

Industry: Hungary's reindustrialization strategy is the "Irianyi Plan" on defining the directions of innovative industrial development. The Plan supports energy and material-efficient production, employment and vocational training, the use of renewable energy sources (mainly biomass and geothermal energy), transport development, and the production of second-generation biofuels. Under the "Irianyi Plan", export capacity should be increased and the development of a higher value-added industrial structure should be encouraged. Domestic raw materials must also be processed with high added value. The Irianyi Plan emphasizes the circular economy with zero waste, which also mitigates the effects of climate change.

As stated in the "Irianyi Plan", significant demand can be generated by state funds for the manufacture of vehicles (public transport), the defense industry, the construction industry, the textile industry and the production of medical devices.

As described in the "Hungary's Convergence Program (2020-2024)", the already announced and implemented in the coming years, with a total value of more than HUF 4,000 billion in corporate investment and manufacturing developments, will grow more dynamically than average the food industry, the chemical industry, metal processing, mechanical engineering (especially the automotive industry).

As a result of the developments, Hungary's export performance may increase by 34-56% after the implementation of the developments, and in the coming years they may add a 12-16 percentage point boost to the growth rate of the Hungarian economy. In addition to large investments, a 30-50% non-repayable investment subsidy was made available by a decree of the Ministry of Foreign Affairs and Trade on the competitiveness-enhancing subsidy required as a result of the coronavirus epidemic. The total value of the investments that have been supported so far and will be completed by 30 June 2021 is HUF 377 billion.

Electricity production: In January 2020, the Government adopted the new National Energy Strategy, which sets Hungary's energy and climate policy priorities until 2030, with a 2040 perspective.

According to the strategy, our final energy consumption - while maintaining dynamic economic growth - in 2030 will not exceed the 2005 level of 785 PJ. After 2030, the source of the increase in final energy consumption can only be a carbon-neutral energy source. The cumulative end-use energy saving obligation for the period from 2021 to the end of 2030 is 331.23 PJ, which assumes a steady saving of 0.8% per year. The share of our renewable energy use within gross final energy consumption will increase to a minimum of 21%.

In Hungary, the installed electricity capacity of hydropower production has been 57 MW since 2013, and according to the latest factual data, its production in 2018 was 234.4 GWh. According to Hungary's

National Energy and Climate Plan (ITM 2020), the electricity generation capacity of hydropower will continue to be 57 MW in 2027, and its production will be 244 GWh / year.

According to the WAM (with additional measures) scenario, the combined capacity of biomass and renewable waste will increase from 519 MW in 2020 to 796 MW by 2027, and its production from 2332 GWh to 3029 GWh. According to the WEM (with existing measures) scenario, there is a forecast only for 2020, 2025 and 2030, but the value for 2020 does not reach the actual data for 2018 below, so we use the WAM forecast.

The Hungarian Energy and Utilities Regulatory Authority "Report on the use of renewable energy in Hungary 2010-2018", the installed electricity capacity of biomass in 2018 was 461 MW (solid 385, biogas 76 MW), its production was 2134 GWh (solid 1799, biogas 335 GWh). The use of geothermal energy is currently typical in the heating sector, with 3.35 MW of installed capacity entering electricity generation in 2017, and with production 1 GWh in 2017 and 12 GWh in 2018. There is no specific target for the application to electricity generation, only with other renewables in total, but according to Hungary's National Energy and Climate Plan, a slight increase in geothermal capacity is expected (with built-in capacity 60 MW by 2030 and 104 MW by 2040).

The spread of electricity-producing geothermal power plants covered by the Swiss-Hungarian Cooperation Program II is planned from 2020 onwards, which may be encouraged by the pilot project for the Geothermal Guarantee Fund.

According to the 2018 report "Medium- and long-term source capacity development of the Hungarian electricity system" of MAVÍR Zrt., the use of geothermal energy is constantly increasing, reaching 4.8 PJ by 2016. By the end of 2016, geothermal energy was used for district heating in 13 settlements in Hungary (which was 56% of geothermal energy consumption). Of this, the agricultural sector mainly utilizes the extracted geothermal energy for heating greenhouses (29%), and the commercial and public service sector for the supply of spas, hospitals and other public institutions (14%).

Ukraine

The forecast of economic and social development of Ukraine for 2021-2023 was approved by the resolution of the Cabinet of Ministers of Ukraine (CMU) from 29.07.2020 №671 "About approval of the Forecast of economic and social development of Ukraine for 2021-2023". The baseline scenario envisages a resumption of the positive trend of economic development after significant losses caused by the global COVID-19 pandemic in 2020, and GDP growth at 4.6% in 2021, 4.3% in 2022 and 4.7% in 2023.

In August 2020 CMU was approved the State Strategy for Regional Development for 2021-2027. The priority tasks of the new regional policy are to accelerate the economic growth of the regions, increase their competitiveness. A number of measures are envisaged in the direction of "Development of the territories of the Ukrainian part of the Danube region and cross-border cooperation". In particular

- taking into account in the sectoral strategies the priorities of the EU Strategy for the Danube Region in the areas of transport sector development, agricultural production, environmental protection, tourism development, promotion and protection of cultural heritage, etc. ;
- promoting international technical assistance and international financial organizations to promote regional development, in particular in the Danube River Basin;
- introduction of mechanisms to support cross-border industrial and technological parks, economic and industrial zones on the territory of Ukraine in order to stimulate regional economic development;
- creating conditions for socio-economic and environmental development of the Ukrainian part of the Danube region, which includes, in particular, the development of transport infrastructure with the Danube countries and crossing the state border, addressing the issue of quality water supply and flood protection.

In Danube region the volume indices of industrial and agricultural production (as a percentage of the previous year) will maintain positive dynamics and in 2027 will reach the level of 103.3 and 104.0 interest respectively. Further development of agriculture is envisaged. In the context of smart specialization, a significant effect can be given by strengthening the link between agriculture and the food industry, which will increase the added value of the final product. Agricultural production will grow by an average of 1.5% per year.

The volume of sold industrial products (goods, services) will gradually increase.

The foundations for the formation of a forest cluster on the basis of deep wood processing and increase in value added, furniture production will be laid. Under the implementation of the optimistic scenario with an emphasis on innovative modernization, the volume of industrial production will increase at least 3 times, which will increase jobs 2 times.

High rates of capacity modernization will also be observed in the food industry, sectors related to wood processing.

The growth of the tourism industry is forecast. The revenue from the tourist tax to local budgets will increase significantly - almost 1.7 times.

Significant growth of investments in the region's economy is forecast. Thus, fixed capital investment should more than double, and foreign direct investment by one-fifth.

PROGRESS OF MEASURE IMPLEMENTATION IN URBAN WASTEWATER AND INDUSTRIAL SECTORS

ANNEX 14

Table 1: Measure implementation in the urban wastewater, industrial and detergents sector

Country	Basic / supplementary measures								Remarks
	UWWTD implementation				Funding sources (mil. Euro)		IED and BAT	P-free detergents	
	Agglomerations <10,000 PE	Agglomerations >10,000 PE	Sensitive areas %	Spent or estimated total costs to reach compliance (mil. Euro)	EU	National	Status of implementation and trend		
DE	Accomplished.	Accomplished.	Art. 5(8), combined with Art. 5(4).	Full compliance reached, no further significant costs.	Will be made available at a later point in time.	Will be made available at a later point in time.	Implemented, continuous improvement corresponding to updating BAT.	P-free detergents are in use.	Basic measures implemented, a minor number of projects still pending.
AT	Accomplished.	Accomplished.	Art. 5(8), combined with Art 5(4).	Full compliance reached, ongoing costs for maintenance and reinvestments.		80 per year for municipal drinking water provision and wastewater treatment/disposal (for current period 2017-2021).	Implemented, continuous improvement corresponding to updating BAT.	P-free detergents are in use.	Basic measures implemented.
CZ	Accomplished.	Accomplished.	Whole territory.	Full compliance reached, ongoing costs for maintenance and reinvestments.			Implemented, continuous improvement corresponding to updating BAT.	P-free detergents are in use Dishwasher agents: P content is not restricted. Detergents with concentration of P lower than 0,5 % weight are in use except in industries and institutions where washing is organized by specially trained persons.	Supplementary measures are planned as part of RBM Plan.
SK	2,000 ≥ agglo. <10,000 PE: 2015 – not fully accomplished yet.	2010– not fully accomplished yet.	Whole territory Art. 5(8).	Next 500-800 (for agglo. ≥2,000 PE).	425-680.	75-120.	Implemented, continuous improvement corresponding to updating BAT.	The EU Regulation No 259/2012 as regards the use of phosphates and other phosphorus compounds in consumer laundry	Basic measures: small number of projects still pending, lack of financial sources. PROGRESS OF MEASURE IMPLEMENTATION IN THE AGRICULTURAL SECTOR

ANNEX 15

Table 1: Nitrates Directive implementation

Country	MEASURES						
	Nitrates Directive implementation status	NVZ designation method and NVZ area (ha agricultural land)	Manure storage capacity (months)	Prohibition periods for applying fertilizer and manure (months)	Limitation of N and P application		Restrictions of some agricultural activities on slopes (slope in %)
					kg/ha on agricultural land	kg/ha on grass land	
DE	Implemented.	Whole territory approach according to Article 5 (6) of the ND. In addition areas with a high nitrate contamination of the groundwater are designated ("red areas"): 385 Tha in whole Bavaria 30 Tha in whole Baden-Württemberg.	At least 6 months: Manure and digestate that are produced on the farm have to be stored for a fixed time. Liquid manure and liquid/solid digestate require 6 month storing capacity. Farms with more than 3 LSU/ha or without own application areas have to prove 9 months storing capacity for liquid manure. For solid manure and compost the required storing capacity has to be at least 2 months.	On arable land the prohibition period starts with the harvest of the last main crop and lasts up to including 31st January. If an autumn application is required, the following exception applies for: - catch crops, winter rapeseed and field forage, - winter barley after growing grains These crops can be fertilized until 1st October with up to 30 kg of ammonium-N or 60 kg total-N per ha. On grassland the blocking period starts with 1st November and lasts up to including 31st January.	170 kg N/ha from livestock manure in line with ND.	170 kg N/ha from livestock manure in line with ND.	The minimum distance to water bodies for the fertiliser (N/P) spreading: The width of the fertiliser-free strip depends on the terrain slope and the technique: Areas that have a slope of less than 5% require a distance of 4 meters to the top edge of the embankment. If a boundary spreading device is used the fertiliser-free strip is reduced to 1 meter. On farm- and grassland with an average slope of 5% or more in the first 20 meters form the embankment top edge no fertiliser can be spread closer than 4 meters to the embankment top edge. If a boundary spreading device is used the fertiliser-free strip is reduced to 3 meters. For 10% or more the distance is 5 meters. On farm- and grassland with an average slope of 15% or more in the first 30 meters form the embankment top edge no fertiliser can be spread closer than 10 meters to the embankment top edge.

MEASURES							
Country	Nitrates Directive implementation status	NVZ designation method and NVZ area (ha agricultural land)	Manure storage capacity (months)	Prohibition periods for applying fertilizer and manure (months)	Limitation of N and P application		Restrictions of some agricultural activities on slopes (slope in %)
					kg/ha on agricultural land	kg/ha on grass land	
AT	Fully implemented; revised nitrates action programme in force since 1.1.2018.	Whole territory approach according to Article 5 (6) of the ND. Code of good agricultural practice is therefore included in the Nitrates Action Programme (ca. 3.2 mio. ha).	At least 6 months in general; at least 10 months for farms located in communities of Annex 5 with: - more than 100 kg nitrogen annually from pig slurry; - more than 1.000 kg nitrogen annually from slurry, -if more than 60% of agricultural areas are used for maize production, - if no agricultural areas is used by farm or if more than 250 kg nitrogen per hectare of agricultural area per year is produced.	15th Oct - 15th Feb of the following year on agricultural land in general for mineral fertilizer, slurry, biogas slurry and digestates, the prohibition period starts with 15th Nov, if catch crop or following crop is sown until 15th October; 30th Nov - 15th Feb of the following year for mineral fertilizer, slurry, biogas slurry and digestates on grassland, 30th Nov - 15th February for farmyard manure, compost; Application limit for mineral fertilizer, slurry, biogas slurry and digestates within the period -from harvest till the beginning of the respective prohibition period and -for grassland from 1st Oct till the beginning of the respective prohibition period with not more than 60 kg of N per hectare.	60 - 240 kg N/ha depending on crop requirement (expected crop yield) and soil potential in total (170 kg N/ha from livestock manure in line with ND).	40 - 280 kg N/ha depending on no. of cuts.	Application of N containing fertilizers including sewage sludge on agricultural fields with average slope of more than 10% within distance of 20m towards surface waters has to comply with the following obligations: -application of more than 100 kg nitrogen per hectare– with the exception of solid manure and compost - has to be split; -for crops with a late growing season measures for reducing soil erosion have to be applied (horizontal sowing stripes with soil covering plants, buffer strips, direct seeding, vegetation over winter period.

MEASURES							
Country	Nitrates Directive implementation status	NVZ designation method and NVZ area (ha agricultural land)	Manure storage capacity (months)	Prohibition periods for applying fertilizer and manure (months)	Limitation of N and P application		Restrictions of some agricultural activities on slopes (slope in %)
					kg/ha on agricultural land	kg/ha on grass land	
CZ	The 5th Action Programme and NVZ revision for 2020–2024 period, valid since 1 July 2020.	Area of NVZ revised for ND in 2019 (valid since 2020), adjusted to land parcels – 1 895 483 ha (arable land – 1 571 907 ha and permanent grassland - 293 070 ha) – 53,30 % of agricultural area according to LPIS. Quality monitoring report in 2020. Code of Good Agricultural practices application is obligatory in the whole agricultural area according to LPIS – area of 3 556 340 ha (35 563,40 km ²), in line with ND. ND requirements are obligatory for NVZ defined. For the rest of agricultural areas are implemented on the voluntary bases.	The capacity of storage spaces for manure must be sufficient for storing of manure during the period of ban for the fertilization. The deposition of solid manure and solid organic fertilizers on agricultural land is permissible for 12 months at longest. The deposition at the same place can be repeated after 4 years of land cultivation. The capacity of storage spaces for manure will have to correspond to the need for storage of their six-month production.	Use of fertilizers with a slow releasable N on arable land and permanent grassland is prohibited between 1. 6. – 31. 7. (this provision does not apply in the case of subsequent cultivation of winter crops and catch crops) and in period between 15.12 - 15.2. (15. 12. – 28. 2. in highlands). Use of fertilizers with slow releasable N is prohibited between 15.11. - 15.2. (15. 11. – 28. 2. or 5. 11. – 28. 2., in highlands).	The quantity of total N kg/ha applied annually on agricultural land in organic and combined organic/inorganic fertilizers, livestock manure and sewage sludge cannot exceed on average in total area of agricultural land of farm enterprise 170 kg ha ⁻¹ , while including agricultural land appropriate for fertilization. For each crop the N limits of effective N has been defined.	Application of N fertilizing substances is restricted to 160 kg of effective N/ha. The calculation of used effective N dose per ha shall be carried out on the basis of data on total N input in organic and combined organic / inorganic fertilizers and livestock manure.	Appropriate N limits and agrotechnical erosion control measures which are in the conformity with site conditions shall be carried out on agricultural plots with arable land on erosion endangered soils, delimited in accordance with main soil unit (limit of 7 or 12 degrees).

Country	MEASURES						
	Nitrates Directive implementation status	NVZ designation method and NVZ area (ha agricultural land)	Manure storage capacity (months)	Prohibition periods for applying fertilizer and manure (months)	Limitation of N and P application		Restrictions of some agricultural activities on slopes (slope in %)
					kg/ha on agricultural land	kg/ha on grass land	
SK	Implemented, without infringement.	NVZs designed according to Articles 3 (2) and 3 (4) of Nitrates Directive. Existing NVZs represent part of agricultural and as of 31.12.2019 it represented 11 891.47 km ² . Last revision of NVZs, completed in December 2020, will take effect from January 2022.	Storage capacities for solid or liquid manure should correspond with six-month of their production. In the case of insufficient storage capacity, animal manure can be stored at another subject or upload it for other uses in volume corresponding up to 3 month-storage capacity.	Prohibition period of animal manure N application is differentiated according to a) category of animal manure, b) category of agricultural land – separately for arable land and permanent grasslands, and c) climate and ranges from October 5th to 30th November in autumn to February 15th. The period of N application in fertilizers ranges from October 5th to October 20th in the autumn to February 15th. On agricultural land with slope up to 5°, the inspection body may grant an exemption from the ban for a period of 14 days from beginning of the prohibited period or 14 days before the end of the prohibited period.	Besides ND limit (170 kg N/ha from animal manures) N inputs are limited also via maximum total N input with respect to yield level of individual crops as well as the maximum single N rate in fertilizers. P inputs in fertilizers are regulated especially with regard to available soil P supply and crop demand on specified yield.	Total animal manure N rate is limited by NID limit. Phosphorous application on permanent grasslands is not limited and its input is mainly from animal manure or excreta.	On the slopes are the following restrictions / demands: 1) To use the agricultural land as arable land with a slope above 12°; 2) Apply fertilizer N on slopes above 10° at arable land unless incorporated into soil within 24 hours after application; in the case of permanent grasslands it applies on slopes above 12°; 3) On agricultural land adjacent to water resources with slope below 7°, application of nitrogen fertilizers shall not be used in zone 10-20 m from the bank of water course or flood line of reservoir. 4) On the arable land adjacent to water resources with slopes above 7°, fertilizers containing nitrogen must not be applied in zone 25 m from water courses; in the case of row-crops are cultivated on these spots, additional of defined measures must be taken.
HU	Hungary implements Nitrate Directive under Government Decree No. 27/2006 (II.7.) on the protection of waters against pollution caused by nitrates of agricultural sources and under Regulation 59/2008. (IV.29) FVM on the detailed rules of the action programme	HU transposed the ND. The designation entered into force by Government Decree No. 27/2006. (II.7.) on the protection of waters against pollution caused by nitrates of agricultural sources. The designation was carried out according to the ND. The revision of the NVZ's is fulfilled. The rules of the Code of Good Agricultural Practices are obligatory on the NVZ's (6,5 million	In accordance with The Code of Good Agricultural Practice the capacity of the farmyard manure storage facility shall be sufficient for the storage of 6 months' volume of farmyard manure.	No manure shall be applied between 30 Nov and 15 Feb, except for the top dressing of winter cereals where manure application will be permitted from the 1st Feb. The post-harvest application of manure containing readily soluble nitrogen is prohibited if no new crop is sown in autumn. The application of fertilizers is not allowed on frozen soil and on lands saturated with water or covered with snow.	The annual volume of N applied through organic manure on agricultural areas may not exceed 170 kg/ha. Whether it originates from grazing or from livestock farms, the volume of N applied shall be calculated by using the values in the rules of the action programme. On NVZ areas the maximum volume of total (organic + inorganic) N kg/ha allowed for major	No special limit value for grass land in Hungary.	As for plantations on slopes more than 15 %, fertilizers may be applied only if the anti-erosion measures specified in the soil protection plan to be compiled pursuant to separate legislation are fulfilled. The application of slurry will not be allowed on slopes above 6%, except if done with the sliding hose (hose curtain) procedure that may be used on slopes of maximum 12%. If applied on slopes above 12%, the chemical fertilizers shall be promptly incorporated into the soil except for top dressing. The application of fertilizers will not be allowed on slopes above 17%. On slopes more than 2 % for the hindering of erosion such cultivation method shall be used which enhances the absorption of rainwater in the soil due to the conservation of the soil structure and the

RS	Draft version is prepared 2016 through the cooperation Project with Swedish EPA (Designation of sensitive and vulnerable zones according to the ND and UWWD - ENVAP II), but need revision, will be adopted in accordance with the new Water Law. Draft version of the Code of Good Agricultural Practice is also prepared through the ENVAPII project. It is now in the process of updating.	Legal framework for manure storage capacity is in preparation. Recommendation for storage capacity is 6 months and will be implemented via transposition of ND.	There is no regulation in Serbia which prohibits the periodic applying of fertilizers on agricultural land during the year. Traditionally, fertilizers are not applying on a frost or snow-covered land.	n/a	n/a	According to the Law on Agricultural land (2018) agricultural area with a slope greater than 10% has to be cultivated parallel to contour lines and area with a slope greater than 25% should not be used as arable land. Responsibility for implementation these restrictions is under local government.

RO	Ongoing.	For the first Action Program (2005 – 2008), a surface of 16,000 skm (6.7 % from the total surface) was designated as NVZ. Since December 2008, the NVZ surface increased at 137,500 skm (13,750,000 ha), which was representing 57.7 % from the total surface. Since 2013 Romania adopted whole territory approach - art 3 (5) ND. (23,839 mil. ha, 100% of the total surface). The Action Program (AP) and the Code of Good Agricultural Practices (CGAP) are reviewed every four years. The AP is mandatory at the national level. The CGAP is mandatory be applied for RD voluntary for the rest of farmers, since 2021.	Manure storage capacity will be given by the period of prohibition for the application of fertilizer/ manure to which is added one additional month.	Prohibition periods for the field application of fertilizers are defined by the time period which the crop nutrient requirements are low and the risk of leakage / runoff is high. So, in the pedo-climatic conditions of Romania, the prohibition periods for applying fertilizer and manure are calculated based on the 30 years climatic data for the time interval which the average air temperature is below 50C. The end of the prohibition period for the application of solid and liquid organic fertilizers, is when air temperature becomes higher than 50C. In this respect three are region categories with specific prohibition period as following: 1- plain, 2 - hill, 3 – mountain.	The maximum amount of nitrogen from organic fertilizers that can be applied on agricultural field must not exceed 170 Kg / ha / year. Also, in the sanitary and hydrogeological safeguard zone, the fertilizers are forbidden to be applied or handled.	The application of organic fertilizers on permanent meadows (pastures and hayfields) complies to the condition to not exceed the amount of 170 Kg N ha / year and not to apply during the prohibition periods.	AP requirements: Agriculture working soil (including sowing) on arable land with a slope greater than 12%, cultivated with weeds, is carried out along the level of curves. On lands with a slope of more than 12%, the fertilization should be done only by incorporating fertilizers into the soil (no later than 24 hours from the time of application).

	expected till 2024. Methodology for NVZ designation was adopted in 2021. Draft of Good agricultural practice was developed. The adoption of the legislative act is expected at the end of 2021. Scientific bases and technology of optimum cultivation of separate cultures are developed. It is not a mandatory document just a set of recommendation.	this Law manure storage is allowed in specialized storage places, authorized in conformity with an established procedure. The large agricultural enterprises store manure both liquid and solid forms. Household manure storage are only as solid. The capacity of manure facilities must be at least 6 months. The total amount of produced manure in Ukraine was 19 772 thousand ton in 2020.	established depends on the content of N or P in soil and volumes of application of organic fertilizers. Appropriate recommendation nitrogen fertilizers are applied only in spring (if soils are sandy or sandy loam – directly before planting). 20 % of phosphorus are recommended to apply in spring and 80 % – in autumn. For NVZ nitrogen fertilizers application is regulated by the 2nd annex of the Code of Good Agricultural Practice. In Ukraine it will be named “Rules for ensuring soil fertility and the use of certain agrochemicals”. The draft Order of the Ministry of Economy has been adopted and is currently undergoing interdepartmental approval. Adoption of the Order is expected by the end of 2021. The prohibition period depends on natural zone and type of mineral fertilizer. On average, the use of mineral fertilizers is prohibited during 1st December – 1st February (or March) and 1st June – 31st August (or September). Application of organic fertilisers is prohibited from 1st June till 31 July and 15 November – 15 March for solid form and 15 November – 15 March for liquid form.	crop. Dose is defined by 3 methods: calculation, field, complex. Limitation: Nitrogen 30 - 180 kg N/ha per year, Phosphorus – 45-90 kg P/ha her year, Manure – 20-60 t/ha.	kg/ha. In year 2020 had been applied nitrogen fertilizers: Tizsa basin – 2106.7 t (189.3 kg/ha); Prut basin – 18 337.9 t in Ivano-Frankivska region (105.4 kg/ha) and 7093 t in Chernivetska region (82.1 kg/ha); Lower Danube part – 9 624 t (97.7 kg/ha) in Odeska region.	Restrictions on agricultural work on the slopes in the NVZ are contained in Annex 4 of “Rules for ensuring soil fertility and the use of certain agrochemicals”. Agricultural activities depends of slope: < 3% - cultivation of all cultures is allowed; 3–9 % - soil-protective crop rotations are applied; >9–15 % - the contour-strips organisation of territory and soil-protective crop rotations are applied; >15% - only grass is allowed. By the general estimations about 31,7 % of the lands are eroded in Ukraine. Amount of eroded lands annually increases by 80-90 thousand ha.

Country	MEASURES (situation in 2021)							
	Nutrient Balances (% of farmers obliged to do the nutrient balances)	Measures against erosion: buffer stripes (river in km, m of width)	Erosion-minimizing cultivation systems and catch crops (ha of arable land)	Area with organic production (ha)	Extensive grasslands, natural landscape elements (ha)	Afforestation of agricultural land (ha)	Establishment of wetlands (ha of new wetlands or rehabilitated ones)	On Farm Advice/Extension Services (no of farmers trained)
SK	At present, the calculation of nutrient balances is not obligatory for farmers.	Grassed buffer strips on arable land along water courses are not applied as systemic anti-erosion measure.	Besides the application of anti-erosion measures related to GAEC 5 and measures for row-crop cultivation on slopes over 7° on arable land in Nitrates Directive Action Plan, multifunctional bio-belts at the edge of the fields (if allocated near streams) can contribute to minimization of the soil erosion occurrence. Catch crops represent the optional component when meeting the GAEC 4 requirement, which can be achieved either winter, perennial or inter/catch crops. 40% coverage of arable land on slopes above 12° in the period from 1 November to 1 March is required. Specific numbers are not available at present.	The area under organic farming (including the conversion to OF) in December 2020 was 222896 ha (11.66% of whole UAA).	As extensive grasslands are classified those which fall into following categories: permanent grasslands in NATURA 2000, protected habitats of semi-natural and natural grasslands, and permanent grasslands within organic farming. Final area of extensive grasslands in 2020, after overlapping of respective GIS layers, is 303 883 ha. Area of natural landscape elements, which can be used for fulfilling the greening requirements, was in 2020 2654 ha.	At present it is no longer significant.	Negligible.	Pursuant to Article 14, farmers are regularly trained in the field of water protection within the meaning of the Nitrates Directive. The decisive part of these measures is provided by the Agroinstitute Nitra. In addition, these trainings are also organized by the regional offices of the Slovak Chamber of Agriculture and Food. With regard to advisory services (Article 15), the Agroinstitute Nitra also provides training for the advisors themselves. Information on the number of advisory services to farmers to help them to solve specific problems (including water issues) is not available.
HU	At the time of planning the nutrient management of agricultural areas, the volume of nutrients to be applied shall be calculated in view of the nutrient supply of the soil and the nutrient demand of the crop that is necessary for a crop yield adjusted to the conditions of the	The establishment of buffer stripes has been legislated, the implementation starts from the 1st of Jan 2012.	900 thousand hectares of arable lands are supported by Rural Development Programmes (Agri-environmental Program and Agroecology Program) between 2017-2021, where sustainable farming practices shall be applied. Slovenian chamber for agriculture and forestry (KGZS) organizes trainings and advisory through regional units. Farmers who apply for Agri-Environment Climate Measures must attend training.

Country	MEASURES (situation in 2021)							
	Nutrient Balances (% of farmers obliged to do the nutrient balances)	Measures against erosion: buffer stripes (river in km, m of width)	Erosion-minimizing cultivation systems and catch crops (ha of arable land)	Area with organic production (ha)	Extensive grasslands, natural landscape elements (ha)	Afforestation of agricultural land (ha)	Establishment of wetlands (ha of new wetlands or rehabilitated ones)	On Farm Advice/Extension Services (no of farmers trained)
HR	Farmers are not obliged to do the nutrient balance on their farms.	Buffer stripes are designated through 1st Action Programme and are as follows: – at 20 m distance from the outer edge of a lake bed, or other standing water, – at 3 m distance from the outer edge of water course beds having a width of 5 meters or more, – on slanted terrains along the water courses, having a slope greater than 10% within a distance of less than 10 m from the outer edge of the water course bed. Buffer stripes are also obligatory GAEC 1 according to the Ordinance on Cross compliance.	Problems with soil erosion should be settled through minimal soil cover. On agricultural parcels with slopes of 15% or more, ploughing should be performed only perpendicular to the slope. All GAEC standards prescribed in Ordinance are obligatory for farmers in use of direct payments in Croatia.	In 2013 there were 1609 agricultural producers doing organic production on 3,12% of agricultural land in Croatia.		Ministry of Agriculture does not collect data on afforestation of agricultural land.	In 2012. there is 74.000 ha of wetlands and this number is slightly increased (+2.000 ha) from 1990.	The Agricultural Advisory Service in Croatia employs 239 employees, mostly Agricultural Engineers. It has offices in each Croatian county and Zagreb.
BA		According to Water Law of Federation B&H (an erosion-prone area is an area permanently or temporarily subject to the impact of surface, deep or lateral water erosion, and which is: 1. the source of floods (erosion focus), 2. under the influence of torrents, 3. made up of soil subject to piping, 4. under the influence of sea waves. 	presented in pro mille.							
RO	Romanian farmers have obligations related to implementation of the nutrient balances only in certain conditions, as using irrigation system or if farmers apply chemical fertilizers above fertilizing average quantities, according to the Management Plan for fertilizer at farm level. There are not available data about the % of farmers to do the nutrient balances.	No additional agri-environment measures against erosion (buffer stripes), but there are in force mandatory measures under Nitrate Directive - AP requires additional buffer strips besides the ones stipulated in Romanian Water Law 107/1996 with further amendments (where the buffer strips must have a width between 2 m to 50 m, depending by the width of water courses, type and use of water resources or hydrotechnical works). The additional buffer strips must have a width: a) 3 m for land with slope < 12%; b) 5 m for land with slope > 12%.	Applied being considered an important measure for prevention of soil erosion. In 2020 the surface of reclaimed land with technical works for erosion control was 158,869 ha, representing around 1.2% of arable land (source: Ministry of Agriculture and Rural Development). This measure is also found in Action Plan: - covering the sloping lands with agricultural crops during the winter period; - maintaining a minimum amount of vegetation to cover the land during rainy, snowy or frosty periods.	In 2021, the area of organic production covered 484719 ha, representing over 3% of the agricultural area (source: Ministry of Agriculture and Rural Development).	In 2021 the surface with extensive grasslands, natural landscape elements was 750513 ha, representing over 5% of the of the agricultural area (source: Ministry of Agriculture and Rural Development). These represent the surfaces with commitments for agri-environmental for extensive grassland management under EU financing National Programme for Rural Development – Pilar II CAP (grasslands with high natural value, important grasslands for birds and butterflies, important agriculture land as feeding areas for the Lesser Spotted Eagle (Aquila Pomarina) and bustard (Otis Tarda).	According to the data of Ministry of Agriculture and Rural Development the afforestation has registered a slight increasing less than 1% (2013-2019).	There are measures and studies proposed in the Program of Measures of the updated River Basin Management Plan, which were implemented particularly in the second and will continue to be implemented in the third planning cycle. Project Danube Floodplain areas – 102549 ha (Danube flood plains with the reconnection potential). Flood Risk Management Plan, and RBMP measures – 3600 ha (natural water retention measures - wetlands).	Ministry of Agriculture and Rural Development trained 5235 persons in the topic of implementation of agri-environment obligations. Number of farmers trained by knowledge and training providers on Code of Good Agricultural Practices (male/female disaggregated) - 6057 farmers received a one-day training. Out of them 4181 farmers received a second one-day training. 280 discussions groups were set-up, supported by 180 champion farmers and 50 communal platforms hosting manure management good practices and demonstrations.

MD	There exist no legal provisions to keep the Nutrient Balance by farmers.	From 2009 till 2012, area under forest protection strips has decreased by 3%. In August 2014, GoM ratified Program for Soil Fertility Improvement and Increase 2011-2020 which stipulates applying of mitigation measures against erosion. In January 2014, GoM approved National Plan on extending the forest vegetation areas for 2014-2018. The proposed measures provide for afforestation of the degraded lands, the strips for the protection of rivers and water basins, as well as the strips for protection of farmlands over an area of at least 13,000 hectares. The national plan also aims at protecting the soil against erosion and improving the water balance. The estimated cost of the actions envisaged in the plan amounts to about 295 million lei, with the money earmarked from the state budget, National	Systems are being applied, but precise data are unavailable. Estimate data 433000 ha of arable land in the MD part of the Put River basin).	Inn 2006, the organically farmed area amounted from 11000 to 12.392 hectares. By 2015, area under organic farming has to increased up to 31.100 ha. The production volume shall be increased to about 75.000 tons (mainly, wine, sunflower oil, walnuts, lavender oil, honey, and dried and frozen fruits) – these data were provided by three certification bodies.		Executive Forest Agency, Ministry of Agriculture, Food and Forestry. A total of 592,3 ha of afforestation of agricultural land for the period 2007-2012 was realized within the Bulgarian part of the Danube River District. According to the annual report of the Executive Forest Agency for 2013 the total area of the forest territories for the whole county has increased with 16 706 ha in 2013 compared to 2012. Afforested area increased with 15 788 ha in 2013	Ca. 200 ha (Middle & Low Prut).	Agricultural extension services are well developed through a network of non-state institutions, private companies, technical assistance projects, and farmer organizations. The foundations for the extension system are offered by the non-governmental organization National Rural Development Agency (ACSA), which includes a network of 35 Regional Centres Service Providers, 425 consultants (350 local, and 75 regional). On an annual basis, the network provides over 250 thousand advisory services, including around 3500 seminars and training programs, approximately 3000 written recommendations, 2500 round tables and meetings, over 45 thousand on-site visits and approximately 200 thousand individual

UA	There exist no legal provisions to keep the Nutrient Balance. According to the "Rules for ensuring soil fertility and the use of certain agrochemicals" for the nutrient management in the NVZ the volume of nutrients to be applied shall be calculated in view of the nutrient supply of the soil and the nutrient demand of the crop that is necessary for a crop yield adjusted to the conditions of the actual. Soil analysis in every 5 year is an important element of this assessment.	According the Item 87 of the Water Code buffer stripes for small rivers are 2.5 m of width, for middle rivers – 50 m, for big rivers – 100 m. On slopes the width of buffer strips doubles. Other measures against erosion: crop rotation, crop nutrient management with soil testing, the use of organic fertilizer, avoiding of deep ploughing, contour ploughing, strip cropping, livestock grazing practices, etc.	Environment-friendly practices which included erosion-minimizing cultivation system (crop rotation, crop nutrient management with soil testing, the use of organic fertilizer, avoiding of deep ploughing, contour ploughing, strip cropping.) are stimulated by State (financial support).	According to various estimates the organically farmed area amounted 280 000 hectares. The Law on organic manufacture is accepted on 21 April 2011. Besides, the Law about safety and quality of food operates in the country. The Government Programme on development of organic farming is accepted. According to the monitoring conducted by the Ministry of Economy, in 2019 the total area of agricultural land with organic status and transition period amounted to 467,980 ha (1.1% of the total area of agricultural land in Ukraine). At the same time, there were 617 operators of the organic market, 470 of them were agricultural producers. According to the International Independent Scientific Research Institute of Organic Agriculture (FiBL), in 2017 Ukraine ranks eleventh in Europe over the total area of agricultural land certified as organic. Certification bodies have been created with the help of Switzerland. A new program "Organic Trade for Development in Eastern Europe" (OT4D) was launched		Forestation area: 2016: 63 231; 2017: 64 713; 2018: 51 519 2019: 48 837; 2020: 44 798. Including forest planting and sowing: 2016: 2 783; 2017: 2 072; 2018: 2 239 2019: 2 180; 2020: 2 272.	Black Sea region of Ukraine has 600 thousand ha of wetlands. One has the status of the international importance (Danube plavni). Programs of rehabilitated systems in Lower Danube (irelands Tatarin, Ermakov, lakes Katlabukh, Saf'yani) are ongoing in cooperation with Wild World Fund. About 12 000 ha (33 objects) will be restored at performance of the Tizsa RBMP.	The Low on Farm Advice activity has been adopted on 17.06.2004, some changes have been brought in 2010. The three-level system of advisory services is created. Public National association of Advisory services has been registered: www.dorada.org.ua. Agricultural extension services are well developed through a network of non-state institutions, private companies, technical assistance projects, and farmer organizations. The foundations for the extension system were established with the technical assistance of a number of the European countries. In Tizsa basin (Zakarpatska region) operate 3 Regional Centres, in Prut basin - 7 Regional Centres, in Lower Danube part – 2 Regional Centres.

PROGRESS ON MEASURES ADDRESSING HYDROMORPHOLOGICAL ALTERATIONS

ANNEX 16

This Annex includes information on progress in measures implementation for the following hydromorphological alterations for each country and on the basin-wide scale:

- Hydrological alterations – Impoundments
- Hydrological alterations – Water abstractions
- Hydrological alterations – Hydropeaking
- Interruptions of river and habitat continuity
- Morphological alterations – River morphology
- Morphological alterations – Disconnection of adjacent floodplains / wetlands

It provides further detailed information on data already provided in the JPM Chapter 8.1.5 of the DRBM Plan – Update 2021.

For particular measures involving construction or building works (e.g. a fish pass, a river restoration project, etc.), the following status-classes were reported, whereby the implementation status refers to the status expected at the end of 2021.

- **Not started** means the technical and/or administrative procedures necessary for starting the construction or building works have not started.
- **Planning on-going** means that administrative procedures necessary for starting the construction or building works have started but are not finalised. The simple inclusion in the RBMPs is not considered as planning in this context.
- **Construction on-going** means the construction or building works have started but are not finalised.
- **Completed** means the works have been finalised and the facilities are operational (maybe only in testing period in case e.g. a waste water treatment plant).

1. Introduction

In order to enable a sound estimation of where to target measures most effectively at the basin-wide scale, an **ecological prioritisation of measures to restore river and habitat continuity** in the DRBD has been carried out. A respective study has already been performed for the first DRBMP in 2009 and was further developed updated for the DRBMP Update 2015.

At the Danube Ministerial Meeting 2010, the Danube Declaration was adopted, inter alia reconfirming the commitment “*to further develop and make full use of the ecological prioritisation approach for measures to restore river and habitat continuity in order to ensure that they are ecologically most efficient*”. The Danube Ministerial Declaration of 2016 underlines “*the need to focus on priority measures taking into account the results of the ecological prioritisation approach for continuity restoration*”. In order to take a step in the further development of the approach, discussions have been conducted in the frame of the ICPDR, considering different criteria and rankings. Following data provisions for the DRBMP Update 2021 and further input from Danube countries, the prioritisation index was updated.

2. Objective

All fish species of the Danube River Basin (DRB) are migratory to some extent, however, the importance of migrations for the viability of fish populations considerably vary among species. Migrations are different in terms of migration distances, migration direction (upstream, downstream, lateral), spawning habitats, seasons, life stages, etc. In general, in the DRB migratory requirements are more distinct in lowland than in head water fish communities (

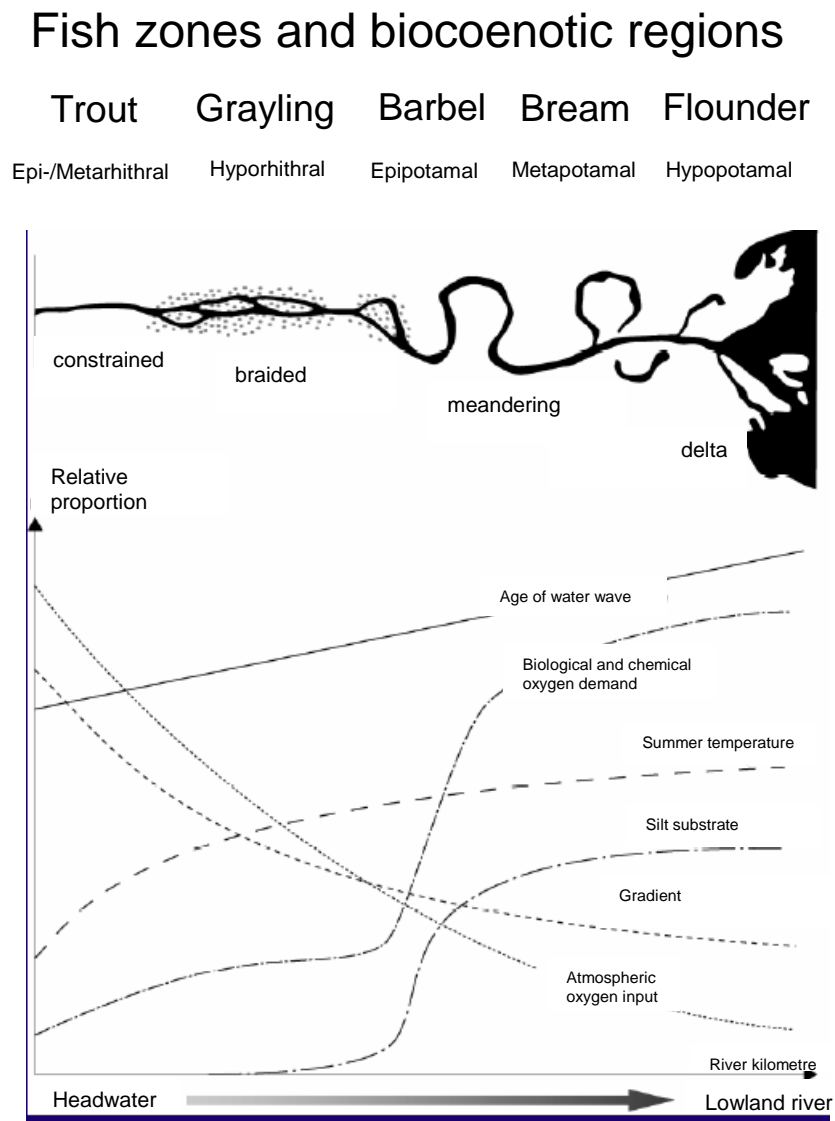

Figure 1).

Long-distance-migrants (LDM) such as the Beluga sturgeon (*Huso huso*) migrated up to several thousand kilometres from the Black Sea to the Barbel zone in the DRB. Medium-distance-migrants (MDM, so called potamodromous fish species) like nase (*Chondrostoma nasus*) and barbel (*Barbus barbus*) migrate within the river over distances of 30 to 200 km (Waidbacher & Haidvogel 1998). A significant number of lowland fish species depend on floodplain spawning habitats during spring season. Contrarily, headwater fish species migrate comparable short distances as living and spawning habitats are mostly not far away. To ensure the achievement or the maintenance of the good ecological status on a long term, all species need an open continuum for e.g. recolonization after catastrophic events and genetic exchange.

The Vision stated in the DRBMP Update 2021 envisages the “Construction of fish migration aids and other measures at existing migration barriers to achieve/improve river continuity in the Danube River and in respective tributaries to ensure self-sustaining sturgeon populations and specified other migratory fish populations”. The overall goal of continuity restoration in the DRBD should be free fish migration routes within the entire DRB. However, due to the high number of barriers and limited resources a prioritisation of measures is necessary. The ecological prioritisation approach provides indications on a step-wise and efficient implementation of restoration measures on the basin-wide scale. The approach provides useful information on the estimated effects of the national measures in relation to their ecological effectiveness and could serve as a supportive tool for future measure implementation. Therefore, it also supports the

feedback from the international to the national level and vice versa in the DRB. The ecological prioritisation approach represents an important component for River Basin Management Planning and could constitute an important basis for discussions on measures addressing river and habitat continuity interruptions within the Joint Programmes of Measures (JPM).

Figure 1: Fish zones and abiotic conditions in running waters (adapted from Jungwirth et al. 2003)

3. Distribution of long- and medium-distant migrants in the Danube River Basin

3.1 Methodology (LDM and MDM in the DRB)

Historic upstream occurrence of long-distance migrants (LDM) of riverine fish in the DRB is dominated by sturgeon species as those species are known to have migrated long distances within the Danube catchment. A sturgeon migration map provided by the ICPDR was compared and updated with recent literature reviews and results of the EU-project EFI+ (Evaluation and improvement of the European Fish Index, <http://efi-plus.boku.ac.at>) (Schmutz & Trautwein 2009).

The potential distribution (habitat) of MDM was modelled using data from the EU-project EFI+ including data from the DRB and other catchments in Europe. Within the frame of the EU-project EFI+ most of the European fish species have been classified according to their migratory behaviour, i.e. long-distance-migrants (LDM see Table 1), medium-distance-migrants (MDM see Table 2) and resident species (RS). Out of the 58 fish species classified as MDM 9 key species were selected occurring in the DRB (Tab. 2) (Schmutz & Trautwein 2009).

Table 1: Examples for long distance migrants (LDM) in the DRB (based on EFI+ guild classification, see <http://efi-plus.boku.ac.at>)

Nr.	Scientific name	English name
1	<i>Huso huso</i>	Great sturgeon, beluga
2	<i>Acipenser guldenstaedti</i>	Russian sturgeon
3	<i>Acipenser nudiventris</i>	Ship sturgeon
4	<i>Acipenser stellatus</i>	Stellate sturgeon
5	<i>Alosa caspia</i>	Caspian shad
6	<i>Alosa immaculate (pontica)</i>	Pontic shad

Table 2: List of medium-distance migrants (MDM) in the DRB (based on EFI+ guild classification, see <http://efi-plus.boku.ac.at>) used for modelling habitat of MDM in the DRB

Nr.	Scientific name	English name
1	<i>Abramis brama</i>	Common bream
2	<i>Abramis sapa</i>	Danubian bream
3	<i>Acipenser ruthenus</i>	Sterlet
4	<i>Aspius aspius</i>	Asp
5	<i>Barbus barbus</i>	Barbel
6	<i>Chondrostoma nasus.</i>	Nase
7	<i>Hucho hucho</i>	Danube salmon
8	<i>Lota lota</i>	Burbot
9	<i>Vimba vimba</i>	Vimba

The consolidated EFI+ database comprises about 10,000 sites all over Europe. About 1,000 sites are located in the DRB. Unfortunately, the number of sites from the Danube catchment with occurrence of MDM is small (379 sites) and not sufficient for model calibration. Therefore, data from additional European catchments comparable with the DRB was used. By restricting the selection of data to Illies's ecoregions 3

to 16 we tried to avoid a bias from Mediterranean (Iberian) and Nordic (Scandinavia) influences, as the distribution of MDM might follow different rules in those areas. Out of the resulting 3,800 sites Schmutz & Trautwein (2009) selected all sites (1,268 sites) where MDM were recorded and randomly a similar sized set of data from sites where MDM did not occur. In total, about 2,500 sites were used to calibrate the model.

Regression Tree techniques were used for modelling MDM occurrence as this technique allows using also non-normally distributed data. All modelling was done with the open source software R[®]. The Regression Tree function of R[®] (rpart) includes an internal validation as the variable selection and splitting process is repeated 500 times. The results were additionally validated by using only data from the DRB (Schmutz & Trautwein 2009).

For calculating predictive environmental variables such as catchment size, elevation and river gradient the CCM river model was used developed by the JRC in Ispra (Vogt et al. 2007) which had been also used for the EFI+ project. The CCM is a modelled river network and hence there are slight deviations between the modelled river courses and the real ones. This is mainly true in the headwaters where the CCM sometimes selects different tributaries compared to other maps. Another problem may occur in lowland rivers with very low gradient in plain terrain where the actual and modelled river course may deviate. The deviations do not significantly affect the results as environmental variables used for the modelling are quite stable against river course deviations.

3.2 Results (LDM and MDM in the DRB)

Information on the natural distribution of LDM sturgeon species in the DRB served as a basis (Hensel & Holcik, 1997). According to additional data from the EFI+ project and information received from national fish experts of the DRB contacted via the ICPDR slight changes of the original ICPDR maps have been made for the first approach (Schmutz & Trautwein 2009): The occurrence of sturgeon species in the Isar river (Bavaria) was restricted to the lower part of the river. LDM sturgeon occurrence has been added to the lower Inn river and lower Salzach river (Austria). For the DRBMP Update 2021, the lower part of Zagyva river was changed from LDM to MDM.

The modelled distribution of the MDM in the DRB using Regression-Tree analyses shows that the presence and absence of medium-distance migrants (MDM) is mainly determined by the size of the catchment (Figure 2). River segments with upstream catchment areas (AREA_ctch) less than 284 km² have a very low probability of MDM. In addition, river segments with an upstream catchment size of less than 1,401 km² and a mean elevation of the upstream catchment (ELEV_MN_du) of more than 819 m have also a low probability of MDM. All other river segments have a high probability of occurrence of MDM. The model explains the variability of probability of occurrence by about 42 %. Applying the model to the data, presence and absence can be explained by about 82 % and 78 %. Applying the model to the data from the DRB reveals similar predictions of presence (78 %) and absence (81 %) approving the applicability of the model to the DRB. Figure 2 clearly shows the separation between the habitat of the LDM, MDM and the head waters above the MDM in the DRB. Results of modelled MDM habitat were checked by the countries of the DRB and only minor deviations from the real conditions were reported and included in the final map (Schmutz & Trautwein 2009). For the DRBMP Update 2021, the upper part of Zagyva river was changed from MDM to headwater. Furthermore, since Sio felso (downstream of lake Balaton) is intermittent it is not considered as relevant for MDM species.

The MDM habitat, however, was only modelled for rivers with a catchment >4000 km². It is most likely that the MDM habitat extends also in smaller rivers. Therefore, if this criterion is applied on a national level considering also smaller rivers, all MDM-habitats have to be identified.

Figure 2: Regression-Tree model for medium-distance migrants using data from the EFI+ project: Probability of occurrence and number sites of each branch (upstream catchment areas: AREA_ctch, mean elevation of the upstream catchment: ELEV_MN_du, gradient of river segment: ALT_GRADIENT) (Schmutz & Trautwein 2009).

4. Update of the prioritisation approach of the Danube River Basin

Although the application of different methodologies (GIS approach, optimisation approach) was discussed, the scoring and ranking method (as used in the DRBM 2009 Schmutz & Trautwein 2009) and in the DRBMP Update 2015 (Mielach & Schmutz 2015) was extended by hydrological pressures and again applied in the updated version. It has the advantage of transparency and comprehensibility and allows a direct comparison with the results included in previous DRBM Plans.

Besides ecological criteria, also the inclusion of other economically/ technical criteria was discussed with the result, that such criteria can be incorporated on a national level but the basin-wide prioritisation approach should focus on ecological criteria.

4.1 Methodology

The following chapters describe the process of barrier selection and the calculation of individual criteria for considered barriers. The following datasets were used for the updated approach.

Table 3: Used criteria and datasets

Used data	Dataset (name)
Continuity interruptions Barriers*	Longcontinterr_pv
River network river water bodies >4000km ² * LDM-/MDM-habitat*	DRBMP2021_RWBody4000_I_v
Protected areas water-relevant habitat protection areas (FFH)* water-relevant bird protection areas* other Nature protection areas for water-dependent species and water-related habitats (WFD Art. 5)*	pa_habitat_pv pa_bird_pv pa_other_pv
Hydro-morphological pressures segment with impoundment** segment with hydro peaking** segment with water abstraction**	Hydroaltimp_pv rwbody4000_hydroaltpeak_pv rwbody4000_hydroaltabs_pv

* Original criteria already used for the DRBMP 2009

** Criteria added for DRBMP Update 2021

4.1.1 Continuity interruptions

The dataset (longcontinterr_pv) includes a total of 967 longitudinal continuity interruptions. At the moment, barriers within the LDM-habitat are, if at all, only equipped with fish passes supporting migrations of MDM-species. While these barriers are passable for MDM-species, it has to be assumed that they are still impassable for large sturgeons. Therefore, these barriers were included in the prioritisation index calculation and highlighted in the map to show their current status (i.e. MDM-fish pass in LDM-habitat). Since there are no standardised fish pass solutions for LDM-species, individual measures have to be taken. The adaptation of existing fish passes in Austria and Germany to allow the passage of large sturgeons will be necessary when these species are able to reach the respective barriers, which means, when the Iron Gates

and Gabčíkovo are passable. A respective step-wise approach for continuity restoration is described in the DRBMP Update 2021.

Consequently, all barriers within the LDM-habitat (i.e. 96) and all impassable barriers (i.e. without fish pass) within the MDM (390) were defined as relevant for the prioritisation approach (see Table 4).

Table 4: Identification of barriers relevant for the Prioritisation Index calculation

	No fish migration aid (values 0; 8; G, N, U)	Fish migration aid (value Y)	Total

4.1.2 Main migration routes

The main migration routes of long and medium-distant migratory species as modelled for the prioritisation approach included in the 1st Danube River Basin Management Plan (see chapter 3) were adopted for the updated version. The LDM- and MDM-habitat information was furthermore transferred to the river body network of the ICPDR (RW-Body4000).

The prioritisation principle follows the idea that LDM within the Danube receive the highest priority followed by LDM within the tributaries. MDM receive less priority and head waters which are typical habitats for short distance migrators are excluded from the prioritisation process. Therefore, priorities are considered as follows:

- Long distance migrants habitat in Danube (rating = 4)
- Long-distance migrants habitat in Danube tributaries (rating = 2)
- Medium-distance migrants habitat (rating = 1)
- Short-distance migrants (head waters) (rating = 0)

4.1.3 Location of the barrier (distance from mouth)

Since long- and medium distance migratory fish usually migrate from downstream to upstream, obstacles at the mouth of a river receive higher priority than upstream obstacles and giving more emphasis on the main river (e.g. Danube) than on the tributaries. The more distant an obstacle is located from the river mouth the less priority is given to the obstacle. The two criteria “obstacle in first river segment upstream of river mouth” and “distance from mouth” were already included in the 1st approach. By adding up the individual rankings, the criteria were combined in the updated approach and show the following rankings:

- Obstacle in first fragmented river segment in the Danube upstream of Danube delta (rating = 5)
- Obstacle in first river segment upstream of mouth (rating = 4)

- Obstacle in second river segment upstream of mouth (rating = 2)
- Obstacle in third river segment upstream of mouth (rating = 1)
- Obstacle in segment upstream of third river segment (rating = 0)

River segments are defined as the river stretch between two tributaries. Segments classification in the Danube-tributaries is based on the CCM-river network, which are calculated on the basis of a DEM with 100m resolution¹ (Vogt et al. 2007). The highest priority is given to the barriers at Iron Gate, since these barriers represent the most downstream barriers within the Danube itself.

4.1.4 Reconnected habitat length

In order to achieve the highest ecological effects, higher weight is given to river stretches that are less fragmented by continuity interruptions. The reconnected habitat for each barrier was calculated by adding up the distance to the next up- and downstream barrier, whereby only relevant barriers (i.e. all barriers in the LDM- and all impassable barriers in the MDM-habitat) were considered. The distance was only calculated within the LDM-/ MDM-Habitat and the river, where the barrier was located. For the most downstream barrier within a tributary or the Danube (e.g. Iron Gate), the distance to the confluence/delta was used instead of the distance to the next downstream barrier.

For this criterion different river length classes for the Danube and the tributaries were defined. Based on experiences in the Danube, the following thresholds were defined by expert judgement:

- >50 km (>100 km Danube) (rating = 2)
- 20-50 km (40 – 100 km Danube) (rating = 1)
- <20 km (<40 km Danube) (rating = 0)

4.1.5 Protected site (Natura2000) or national protection site

Apart from the WFD relevant criteria, additional criteria stemming from EU legislation like Council Directive 92/43/EEC on the Conservation of natural habitats and of wild fauna and flora was used, requiring to achieve a favourable conservation status in Natura 2000 areas. Considering that fish species and habitats are also part of the Natura 2000 goals it is reasonable that the protection status also should be considered in the prioritisation approach.

Obstacles within a distance of 500 m of water-relevant Natura 2000 areas which are important for fish receive higher priority as it is more likely that those river segments are maintained in good habitat status or will be restored earlier than unprotected river segments, thus providing good habitat quality. For non-EU member states, other protected areas are used as a substitute for Natura 2000 areas. Therefore, higher priority is given to barriers located within or close (i.e. <500 m) to a water-relevant protection site.

- Barrier within/close to water-relevant Natura 2000 or other protected area (rating = 1)
- Barrier with greater distance to protected areas (rating = 0)

4.1.6 Anthropogenic pressures

In 2015, the prioritisation approach was extended by an additional criterion representing anthropogenic pressures. With regard to impoundments, hydropeaking and water abstraction, it was assessed whether a water body is impacted by these pressures or not. Since more detailed information (e.g. the exact location

¹ River segments are available for download here: <https://ccm.jrc.ec.europa.eu/>

and length of the respective pressures) is not available for all pressures, the number of pressures were summed up per water body and then transferred to the barriers within the water body.

Although also “morphological alterations” were considered as relevant for the prioritisation approach, there is no uniform morphology classification scheme available in the Danube catchment at the moment. While some countries classified the morphological condition of their river water bodies with “1” (i.e. high) and “2-5” (i.e. good-bad) others used a more detailed classification of “1-2” (i.e. high-good), “3” (i.e. moderate) and “4-5” (i.e. poor-bad). Therefore, only three pressure types (i.e. impoundments, water abstraction and hydro peaking) were used for the prioritisation index calculation.

In summary, the following criteria and ratings were used for the calculation of the new prioritisation index.

Table 5: Criteria and their ratings for the Prioritisation Index calculation

Criteria	Rating
1. Migratory habitat	
- Long-distance migrants habitat (Danube)	4
- Long-distance migrants habitat (tributary)	2
- Medium-distance migrants habitat	1
- Short-distance migrants habitat (head waters)	0
2. River Segment	
- First river segment in Danube	5
- First river segment upstream of mouth (tributary)	4
- Second river segment upstream of mouth	2
- Third river segment upstream of mouth	1
- River segments upstream of third river segment	0
3. Length of reconnected habitat (Danube/tributary)	
- >100 km / >50 km (tributary)	2
- 40-100 km / 20-50 km (tributary)	1
- <40 km / <20 km (tributary)	0
4. Protected site	
- Yes	1
- No	0
5. Pressures	
- 0 pressures	3
- 1 pressure	2
- 2 pressures	1
- 3 pressures	0

The selection of prioritisation criteria for continuity restoration was mainly based on the migratory behaviour of LDM and MDM in the DRB. The prioritisation principle follows the idea that LDM within the Danube receive the highest priority (weight 4) followed by LDM within the tributaries (weight 2). MDM receive less priority (weight 1) and head waters are excluded from the prioritisation process (weight 0). Within this prioritisation framework obstacles at the mouth of a river receive higher priority than upstream obstacles whereby a special focus is given to the most downstream barriers in the Danube. The more distant an obstacle is located from the river mouth the less priority is given to the obstacle. In order to give higher weight to river segments that are less fragmented by continuity interruptions, the length of the reconnected habitat depending on the length of river segments was weighted. For this criterion different river lengths

classes for the Danube and the tributaries were defined to consider the river size. The final criterion is related to the protection status. Obstacles within water-related protected areas of the NATURA2000 network and other protected areas for non-EU Member States receive higher priority as it is more likely that those river segments are maintained in good habitat status and will be restored to a larger degree than unprotected river segments. Finally, the new prioritisation index also considers anthropogenic pressures, whereby barriers in less impacted water bodies (0-1 pressures) received higher ratings than barriers in impacted water bodies (2-3 pressures).

Again, the criteria were combined by computing the prioritisation index (PI) by weighting the first criterion (migratory habitat) by the cumulated weight of the other criteria.

$PI_{\text{new}} = \text{migratory habitat} \times (1 + \text{barrier location} + \text{reconnected habitat length} + \text{protected site} + \text{anthropogenic pressures})$

4.2 Results

The downstream – upstream prioritisation concept is clearly visible in the map of prioritisation (see Map 40 in the DRBMP Update 2021). In total, out of 967 barriers, 481 were excluded since they were located in headwaters or already equipped with a suitable fish pass (i.e. MDM fish pass in MDM-habitat). The remaining 486 barriers were considered as relevant for the prioritisation index calculation. It has to be considered, that some barriers were reported twice (i.e. where the river represents the national border between countries), whereby the barrier with the higher prioritisation index (if this applies) is shown on-top of the other. Further harmonization is required, to eliminate related errors.

The results show that according to the defined prioritisation criteria continuity disruptions in the Lower Danube (Iron Gates, 2 barriers with 2 entries) receive the highest priority with values ≥ 40 . Those barriers are considered of utmost priority for LDM species. Also, in the Upper Danube two barriers with utmost priority for LDM- and MDM-species are found. Furthermore, 16 barriers are considered of very high, 22 of high, 114 of medium and 328 of low priority.

4.2.1 The ecological prioritisation approach and sturgeon habitats in the Danube River Basin

The results of the prioritisation index are also reflected in the habitat assessment of the Danube sturgeons within the MEASURES project. The connectivity of the current habitat of LDM in the Lower Danube and vast potential habitats in the Middle Danube are of utmost priority for the conservation and restoration of these species. The prioritisation approach as presented here, clearly supports the coordination of the complex topic of sturgeon conservation on a basin-wide scale. The MEASURES project identified river continuity as one of the most urgent priorities to establish ecological corridors. Especially the barriers at the Iron Gates and at Gabčíkovo separate the Upper, Middle, and Lower Danube into unconnected sections.

The following table shows the results of the classification. The maximum possible value of the prioritisation index is 44 and the minimum is 0 (for barriers in head waters or passable barriers). The prioritisation index was grouped into 6 classes: utmost priority for LDM (>30), utmost priority (21-30), very high priority (16-20), high priority (11-15), medium priority (6-10), low priority (1-5).

Table 6: Results of the updated prioritisation index

Priority	Prioritisation Index I	barriers (total)	thereof with MDM-fish pass in LDM habitat
utmost priority for LDM	44	4(2)	
utmost priority	24	2	
very high priority	20	11	6
	18	1	
	16	4	1
high priority	12	22	8
medium priority	10	25	4
	9	1	
	8	18	5
	7	13	
	6	57	3
low priority	5	100

DETAILED LIST OF HYDROLOGICAL ALTERATIONS

ANNEX 18

Hydrological alterations include pressures that are causing changes to the hydrological regime, i.e. quantity and dynamics of water flow and connection to groundwater bodies, whereby impoundments, water abstractions and hydropeaking were recognized as the main pressure types.

The provoked alterations and applied criteria used for the assessment are provided in the Table.

Hydrological pressures, impacts and criteria for the significant pressure assessment

Hydrological pressure	Impacts	Criteria for significant pressure assessment
Impoundment	Alteration/reduction in flow velocity and flow regime of the river sections caused by artificial transversal structures, alteration of connection to groundwater bodies	Danube River: Impoundment length during low flow conditions >10 km Danube tributaries: Impoundment length during low flow conditions >1 km
Water abstraction /residual water	Alteration in quantity and dynamics of discharge/flow in water, alteration of connection to groundwater bodies	E-flow to achieve GES (according to CIS Guidance No. 31) is not guaranteed or flow below abstraction point <50% of mean annual minimum flow ¹ in a specific time period (comparable with Q95)
Hydropeaking	Alteration of flow dynamics/discharge pattern in river and water quantity, alteration of connection to groundwater bodies	Water level fluctuation >1 m/day, the ratio of low flow to high flow is higher than 1:5, or less fluctuations in the case of known/observed negative effects on biology

Since one hydrological alteration can impact more than one water body and since one water body may be impacted by more than one hydrological alteration, they are listed separately.

Explanation of abbreviations for the tables

AWB = Artificial Water Body

GEP = Good Ecological Potential

GES = Good Ecological Status

HMWB = Heavily Modified Water Body

n.a. = Not Applicable

NWB = Natural Water Body

RWB = River Water Body

¹ A pressure provoked by these uses is considered as significant when the remaining water flow below the water abstraction (e.g. below a hydropower dam) is too small to ensure the existence and development of self-sustaining aquatic populations and therefore hinders the achievement of the environmental objectives. Criteria for assessing the significance of alterations through water abstractions vary among EU countries. Respective definitions on minimum flows should be available in the national RBM Plans.

4. Final remarks - Outlook	37
5. Projects related to hydromorphology and supported by the ICPDR	38

1. Overall context

Over the last century, legitimate water uses (hydropower generation, navigation and flood protection as well as activities related to urban settlements or agriculture) significantly changed the habitat and hydrological conditions of surface waters and thus impacted the ecological status and functioning of river systems.

The alteration of natural hydromorphological conditions can have negative effects on aquatic populations. Based on increased knowledge on hydromorphological alterations and their relevance for the achievement of the environmental objectives, measures have to be taken to restore natural or near-natural conditions. Measures to improve the hydromorphological conditions aiming at improved water status and increasing habitat diversity include

- Hydrological measures (e.g. increase of residual flow, dampening of hydropeaking),
- Restoration of river continuity for fish and sediment (e.g. construction of fish migration aids, improvement of sediment transport),
- Morphological improvements (e.g. removal of bank fixation, reconnection of floodplains).

During the last water management planning cycle (2015-2021), a significant number of appropriate hydromorphological measures were identified, many of them only started or already implemented by Danube countries. Table 1 shows, that most measures are related to the restoration of river morphology and continuity for fish, but also hydrological measures were implemented.

Table 1: Number of hydromorphological measures and their implementation status

	Planning on-going	Implementation on-going	Completed
Hydrological improvements	14	5	10
Restoration of river continuity	21	6	26
Morphological improvements	14	22	29

* for more details, see Annex 15 of the DRBMP Update 2021

To highlight the importance of hydromorphological measures, this brochure presents some lighthouse projects in the Danube River Basin District that were started or implemented since 2015.

2. Overview of measures

Overall, ten measures were reported by Danube countries. Their location within the Danube catchment is shown in Figure 1.

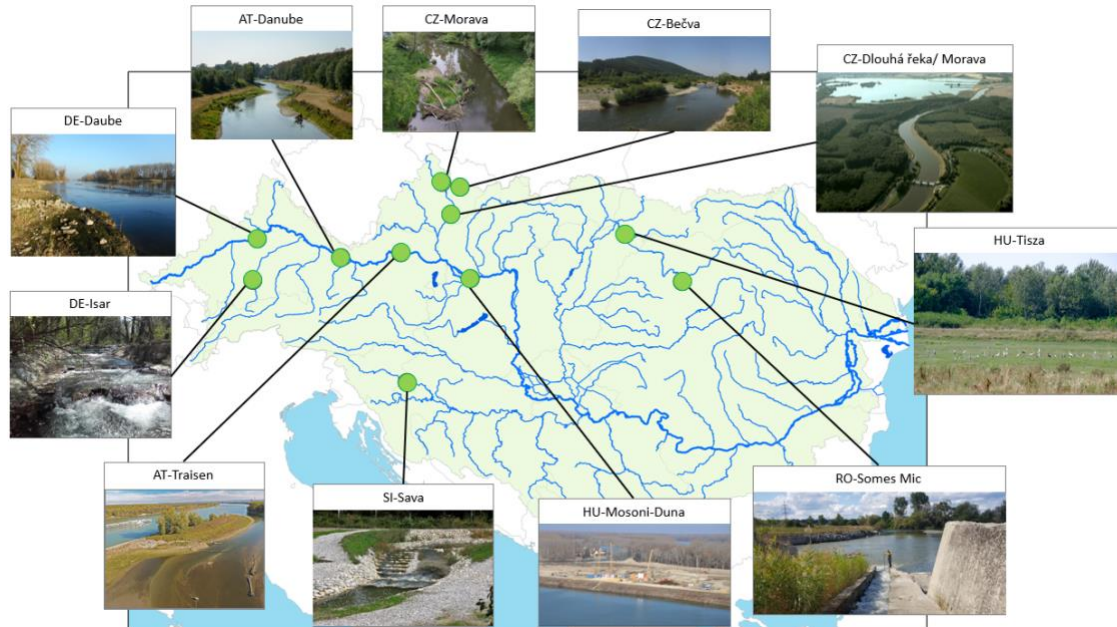

Figure 1: Overview map of hydromorphological measures in the Danube catchment

The main driving forces reported for the eleven lighthouse projects are hydropower (5 cases), flood protection (7 cases) as well as irrigation, land use and navigation (2 cases each). For five locations, several driving forces were reported, while six locations are dominantly changed by one driving force.

At most sites (i.e. 8) measures which serve the restoration of more than one hydromorphological impact type (i.e. related to hydrology, morphology, connectivity) are implemented. The here presented sites provide examples for restoration of river morphology and the riparian zone (7 sites), and/or floodplain areas (8 sites), connectivity for fish (7 sites) and sediment (3 sites). Furthermore, four sites provide examples for hydrological restorations, e.g. by improvement of water retention and flow variability.

Table 2: Overview of hydromorphological measures

Term used	Hydrology	Connectivity ¹	Morphology ²	Benefitting directives	Status
AT-Danube		F	R, F	WFD, Habitats-D, Birds-D	Partly finished (2019, 2023)
AT-Traisen		F	R, F	WFD, Habitats-D, Birds-D	Finished (2019)

HU-Tisza	X		R, F	WFD, Habitats-D	Finished (2019)
HU-Monsoni-Duna	X		F	WFD, Floods-D	Finished (2021)
RO-Somes Mic		F		WFD, Habitats-D	Finished (2017)
SI-Sava		F	R, F	WFD, Habitats-D	Finished (2017)

1) Measures for fish (F) and/or sediment (S); 2) Measures for river/riparian (R) and/or floodplain areas (F)

Nine out of the eleven sites report that the planned or performed measures serve more than one directive (see Table 2). While all restoration measures serve the fulfilment of the European Water Framework Directive (WFD), nine are expected to bring benefits for the Habitats Directive (Habitats-D) and three for the Birds Directive (Birds-D). One is reported to be

beneficial for the Floods Directive (Floods-D). Those projects are thus also highlighting the importance of implementation of synergetic measures that are bringing achievement of different goals related to water management.

Nine lighthouse projects are already finished or expected to be finished by the end of 2021, while one is still ongoing. Another example (AT-Danube) comprises of two projects of which one was finished (2019) and one is still ongoing (2023).

Overall, more than 200 mill. were invested in the measures, whereby costs range from 38,000 € to 82 mill. These costs were often shared between EU, national and other funds (6 cases), or rely entirely on EU- (1 case), national- (3 cases) or other funds (1 case).

Monitoring results are available for five cases. The two fish passes in Romania and Slovenia were proven to be functional. In some cases, an improvement of the ecological status (e.g. from moderate to good status at AT-Traisen) or individual quality elements (e.g. from moderate to good fish-ecological status at DE-Danube) was achieved. A preliminary monitoring at AT-Danube also showed promising results with an increase in endemic species and juvenile life-stages. Further improvements area also expected for the remaining lighthouse projects.

The following chapter provides a more detailed description of the individual lighthouse projects.

3. Lighthouse projects

3.1 AT-Traisen: Creation of a meandering river section in the River Traisen

3.1.1 Initial (impacted) situation

The river Traisen is one of the biggest tributaries of the river Danube in Lower Austria. The river stretch runs through the Natura2000 site “Tullnerfelder Donauauen”, Austria’s largest enclosed wetland. It contains twelve protected habitat types acc. Annex I and 30 protected species acc. Annex II of the Habitats Directive as well as 24 protected bird species acc. Annex I of the Birds Directive.

The Danube floodplains were cut off from the river due to river regulation measures for navigation already in the 19th century. The Danube Hydropower Plant “Altenwörth” was built in the 1970ies and is operated by the VERBUND, Austria’s leading electricity company. With a design flow rate of 2,700 m³/s, the run-of-river plant has a standard working capacity 1,967.6 GWh per year. This power plant thus generates about one sixth of the electricity generated on the Austrian Danube.

During the construction of the Danube hydropower plant of Altenwörth, in 1976 the mouth of the river Traisen was relocated about 7.5 km further downstream. The new river course was heavily regulated disconnecting the river from the surrounding riparian forest and suppressing aquatic and terrestrial habitats that are usually found in floodplains. This situation led to an unfavourable conservation status for the whole Natura 2000 site. Additionally, the estuary was not passable for fish to migrate from the Danube into the river Traisen. For those reasons the concerned water body of the river Traisen reached only poor ecological status according to the Austrian National River Basin Management Plan 2009.

3.1.2 The measure

During the LIFE+ project a meandering river segment was built with a total length of approx. 10 km, which is allowed to develop dynamically during flood events and provides multiple habitats for aquatic species. The old channelized river course was maintained as backwater and flood drainage. The adjacent area of the Traisen was lowered to create about 60 ha of active floodplain habitats and approximately 30 ha of typical river habitats. Furthermore, the river Traisen was re-connected to the Danube and its fish population.

Figure 2: Construction works in the Traisen-area ©Verbund

Figure 3: Restored section of the Traisen River, next to the Danube River (upper right) ©Verbund

The large-scale excavations during the construction of the riverbed and its adjacent floodplain resulted in a material surplus of approx. 1.5 mill. m³, which was partly reintroduced downstream the Danube hydro power plant “Wien-Freudenau” to counteract riverbed incision.

The project has started in 2013 and the overall measure was finished in 2019. The costs of 30 mill. € were split between EU (5.3 mill. €, provided by LIFE funds), the national Environment Fund (3.3 mill. €), VERBUND as the operator of the hydropower plant (15 mill. €), regional funds (1.9 mill. €; Federal State Lower Austria, Fishery Association of Lower Austria, viadonau) and revenue from the excavated and sold gravel (4.5 mill. €).

3.1.3 Conclusion

The LIFE+ project “Traisen” is one of the largest ecological river engineering projects in Austria and in Europe and could only be realized through close cooperation of all project partners.

Figure 4: Restored river section of the river Traisen ©Verbund

Monitoring of the fish biocenosis was carried out during and after finalization (i.e. in 2014, 2016 and 2017). Focus of the monitoring was also laid on the assessment of juvenile fish, of spawning grounds and on temperature changes. Results show an increase from 20 to 33 species. While the old channel of the river Traisen did not provide suitable spawning- and rearing habitats, a high density of juvenile fish of various species were found in the new channel. The re-opening of the continuum to the Danube has directly led to an increase and reproduction of typical Danubian fish species. To sum up, the monitoring showed an increase in the number of species, an improvement in population structures due to higher reproduction rates and an increase in population density. The assessment reveals an improvement of the fish ecological status from moderate (status class 3) in 2014 to good status (status class 2) in 2017. Furthermore, the “good ecological potential” was achieved in the adjacent water body of river Danube.

The approach of providing both – fish migration and high-quality key habitats – ensures a significant contribution to the goals of the Habitats Directive, the Bird Directive, as well as the WFD, thus implementing EU legislation with the aim of best value for money.

3.2 AT-Danube: LIFE “Network Danube” and “Network Danube Plus”

3.2.1 Initial (impacted) situation

The Austrian share of the Danube has a length of 352 km. VERBUND, Austria's leading electricity company, is operating ten large run-of-river hydropower plants along the Austrian Danube which generate about 20% of the public electricity production in Austria

Large sections of the course of the Austrian Danube have been shaped by river regulation and damming measures already in the 19th century. The development of the Danube for hydroelectric power in the 20th century has additionally reshaped about 80% of its course. The ten existing hydropower plants have a significant ecological impact on the Danube river and its floodplains. They cause long stretches with reduced flow velocity and the dams have fragmented the river into environmentally disconnected sections. Moreover, the floodplains and floodplain water bodies along the river are for the most part cut off from the Danube by dams. In the Danube and its floodplains, the key habitat of permanently connected side arms, which provide spawning grounds and nurseries for rheophilic fish species and shelter from ship-induced waves, is missing. As a result of these alterations, the good ecological status/ potential is currently not reached in most of the Austrian waterbodies of the Danube.

3.2.2 The measure

Along the Austrian Danube there are several Natura 2000 protected areas and a National Park. The Natura 2000 area “Tullnerfelder Donau-Auen”, Austria’s largest enclosed wetland, contains 42 species protected under the EUs Birds Directive and Annex II of the Habitats Directive. The National Park “Donau-Auen” in the most eastern section of the Austrian Danube with an extent of over 9,600 ha is the largest complete, (near) ecologically intact natural riverine environment of its kind in Central Europe and provides home and refuge to many endangered plant and animal species.

Figure 5: Continuity restoration in the area of Abwinden-Asten ©Verbund

These areas are not ecologically connected due to the existing hydropower dams and flood protection measures. By restoring the continuity of the river and creating new habitats in the

river and its floodplains, the protected areas can be interconnected by a network of ecological stepping stones.

The two EU-funded projects “Network Danube” and “Network Danube Plus” aim for the restoration of connectivity and habitat improvements in the whole Danube upstream Vienna to the border with Germany. Thereby, they pursue objectives related to the WFD as well as the Habitats and the Birds directive.

Figure 6: Bypass channel at Ottensheim-Wilhering (“LIFE Network Danube”) ©Verbund

The first project “LIFE Network Danube” started in 2011 and was finished in 2019. The following measures were successfully implemented:

- Construction of bypass channels at three hydropower dams to facilitate fish migration in the Danube
- Creation of gravel habitats (gravel banks, gravel islands) in the reservoirs of five hydro power plants on the Danube entailing 325,000 m³ of gravel; and
- Creation of 500 m of branches and side arms on the shores of the Danube.

The project is co-funded by the EU LIFE Programme. The total costs of the measure were 25.3 mill. Euro, whereby 4.3 mill. were funded by EU, 3.8 mill. by national funds, 16.7 mill. by VERBUND and 0.5 mill. by the Fishery Associations of Lower and Upper Austria.

The second project “LIFE Network Danube Plus: Closing the gaps and promoting a river corridor system with an European perspective” started in 2019 and is scheduled until 2023. The main aims of the projects are the following:

- Restoring the passability of the Danube for all fish species: In addition to the construction of fish migration facilities at three Danube power plants, feasibility studies on restoring the continuity are being carried out for the two remaining non-passable dams in the Austrian Danube. By the end of the project, unhindered fish migration will be possible between the Iron Gates gorge in Serbia and the Ybbs-Persenbeug hydropower plant in Austria (over 1,100 km) including the two last free-flowing stretches of the Austrian Danube;
- Creation of habitats by building gravel structures and lateral re-connection with tributaries
- Interlinking Natura 2000 sites (stepping stone biotopes between protected areas)

- Strengthening of fish populations also in the Danube floodplains and tributaries
- Closing the gaps between already implemented LIFE-Projects in Lower Austria
- Strengthening and appreciating the positive impacts of former ecological projects (e.g. the project Life-Traisen)

The project is co-funded by the EU LIFE Programme and the total costs are expected to be 10.1 mill. Euro, whereby 4.2 mill. will be funded from EU, 0.9 mill. from national funds, 4.9 mill. from VERBUND and 0.1 mill. from the Fishery Association of Lower Austria.

3.2.3 Conclusion

For the fish passes Ottensheim and Greifenstein interim results of the monitoring are available showing very good results. In Greifenstein 46 out of 58 endemic species could be evidenced. Furthermore, all stages of age were observed. Using pit-tags long-term monitoring is possible. With the upcoming fish passes and their monitoring more fish will be marked and can give new inputs on the topic of far-distance migration of fish.

Figure 7: Fish pass Greifenstein ©Verbund

The projects “LIFE Network Danube” and “LIFE Network Danube Plus” are demonstrating the suitability of a targeted stepwise approach for achieving the goals of the Habitats and Birds directives and the EU Water Framework Directive on a large spatial scale. The two projects complement each other with interlinking sets of measures and thus are multiplying the overall benefits of each individual project. Additionally, the measures to improve the river’s continuity enhance the positive effects of other renaturation projects. By re-connecting habitats in the Danube and its tributaries the biodiversity and the ecological status in the Danube itself as well as in its floodplains can be improved.

3.3 DE-Isar: Restoration of the ecological continuity in the Upper Isar Valley

3.3.1 Initial (impacted) situation

Due to river construction works in the river Isar for infrastructure protection (flood protection and agricultural land use) erosion caused a continuity interruption between the Isar and its tributary Aumühlbach. Important spawning areas and habitats for juvenile fish could not be reached and thus, the waterbody failed to achieve the good ecological status (in particular for fish).

3.3.2 The measure

In order to re-established the ecological continuity for biota (e.g. European grayling, barbal, nase) a structured ramp was established. It includes ten pools with a length of 4.3 m, which are connected by slots of 0.45 m in width and 0.52 m in height to overcome a fall height of 0.15 m each. As a consequence, important refuges and habitats in the near-natural tributary are once more accessible. The functionality of the structure for fish migration was ensured for a wide range of flow situations.

The measure was finished in March 2018. The overall costs of 90,000€ were covered by national funds.

Figure 8: Construction of the measure

Figure 9: View in upstream direction

3.3.3 Conclusion

The measure is expected to have a positive effect on the fish fauna in the Isar, which showed only a moderate ecological status with regard to its fish fauna before the measure was implemented. The success of the measure will be visible in the Isar in the medium term.

This measure is part of a bundle of measures that support and promote the development of a natural, species-rich and diverse fish community in order to achieve the good ecological potential/ status in the Isar by 2021.

From a nature conservation perspective, the measures are also suitable to support the conservation goals for the protected area (habitats directive) “Oberes Isartal” (Upper Isar Valley). Consequently, the measure supports the achievement of both, the WFD and the Habitats directive.

Figure 10: Finished bypass

3.4 DE-Danube: Improving a Danube water body in the Upper Danube by – inter alia – removal of bank fixations and creation of gravel banks

3.4.1 Initial (impacted) situation

One main reason for not achieving good status in the Danube between Vohburg and Staubing is a severe hydromorphological alteration of this water body at a length of about 20 km. In 2015, the ecological status was „moderate“, because of the assessment of invertebrates and macrophytes/phytoplankton. An additional problem is caused by invasive species, which benefit from the bank protection with (armour-)stones.

3.4.2 The measure

In order to improve the ecological status of the river body and to ensure that a good ecological status could be maintained for the future, a comprehensive programme of measures for this river stretch was set up.

Figure 11: Overview map – location of water body and hydromorphological measures

The complete hydromorphological measures for this river stretch includes the following activities:

1. Structural measures to promote natural retention (~3.8 km)

The natural water retention in the Danube floodplain increases by removing riparian deposits along the riverbank. This was already done on a large scale during the last years and will be continued. In addition, a flood storage basin is to be reactivated by the removal of riparian land and artificial bank protection.

2. Removal/ reduction of bank reinforcement (15 locations, approx. 14 km)

The massive bank protection on the Danube is to be partially or completely removed in areas where it is not indispensable for the protection of settlements, bridges, roads and flood protection facilities.

3. Inserting structural elements in the existing water profile (11 locations, 11.6 km)

Armourstones that are left over from the removal of the bank protection can partly be placed in the river profile. Short groyne (up to about mean water level) increase the variety of currents

in the Danube and promote bank erosion, flow diversity and morphological development in adjacent downstream areas.

4. Creating and redesigning gravel banks

One additional gravel bank is to be created through the introduction of gravel around armourstones. Two existing gravel banks will be redesigned in order to create new spawning habitats for characteristic Danube fish species.

5. Developing floodplain habitats

The development of an approx. 900 m long and 50 – 80 m wide strip with typical floodplain habitats (succession areas, grassland, wet areas) and the development of alluvial forest areas on former intensively used meadows on a stretch of approx. 1.3 km is to be realised.

6. Recreating alluvial waters (5 locations, approx. 3.5 km)

In order to be able to develop a more natural watercourse again, it is planned to divert water from the Danube into new branches to be created at several points. These measures are also intended to improve the habitat conditions for typical fish species.

7. Connecting backwaters

Several backwaters are currently not or not permanently connected to the Danube river. Improvement measures are proposed for four areas.

8. Improving lateral connectivity

The three tributaries to the Danube are not optimally passable for fish, thus the mouth areas will be redesigned. Thereby, the backwaters in the floodplain could also be linked with the Danube.

9. Improving the sediment situation

Due to sediment retention upstream causing a strong bedload deficit, gravel was introduced into the river at two places. It is very likely that sediment input will have to be repeated every 5 to 7 years.

Example for realisation of measures: Creation of a gravel bank for rheophilic fish

A structured gravel bank located in the area of mean flow (~250m long, gradient of ~1:25) was created near the left bank of the Danube for which about 3,000 m³ of Danube gravel were used. A basic structure of hydraulic building blocks serves to stabilize the gravel bank and offers protection against erosion.

The measure was finished in July 2018. The overall costs of 100,000 € were entirely covered by national funds.

Figure 12: Finished gravel bank from aerial view

Since the measure is situated in a protected area (Habitats directive, “Donauauen zwischen Ingolstadt und Weltenburg”), the measure aligns with the WFD and the Habitats directive.

Example for realisation of measures: Removal of bank fixations

The bank fixation of the Danube was removed at approx. 500 m in order to promote the development of structures typical of natural rivers such as bank breaks, backwash and potholes. The lining material was used for creating different groynes. Due to the generous denudation of bank material, a softwood site with high flood dynamics has been created. The measure was finished in November 2018, whereby the overall costs of 60,000 € were entirely covered by national funds.

Figure 13: Removal of the bank fixation

The removal of the bank fixation and the flattening of the steep bank sections also improves access to the Danube and makes the river more tangible for the population.

Since the measure is situated in the protected area (Habitats directive): “Donauauen zwischen Ingolstadt und Weltenburg” (Danube floodplain between Ingolstadt and Weltenburg) the measure aligns with the WFD and the Habitats directive.

3.4.3 Conclusion

The habitat conditions in the river have improved and will further improve as measures are implemented step-by-step. Measure implementation will continue during the next management cycle as well as monitoring of the progress of status improvement. Until now, inter alia, spawning grounds for typical Danube fish species have been created and the floodplain has been reconnected to the river. This is vital for typical Danube fish species. The quality element “fish fauna” has already reached “good status”, invertebrates are still “moderate”.

We expect that the water body will be in good ecological status in the medium term, as the ecosystem needs some time to establish a new “good” equilibrium.

3.5 CZ-Dlouhá řeka/ Morava: Nedakonice water management node

3.5.1 Initial (impacted) situation

Nedakonice water management junction was created in connection with the navigation of the Morava River in the first half of the last century. A weir with a navigation lock was placed in the newly created river channel. By this solution a big part of the original Morava river bed was cut off from the rest of the river. In this section, the mouth of the Dlouhá řeka River was connected to the side arm of Morava, called Morávka. Due to the water management alteration, these flows were also separated from Moravia, which stopped the Morávka from being supplied with water from Moravia and became a continuation of the Dlouhá řeka River. The problems with siltation started very soon, because discharges of Dlouha řeka River was not sufficient to transport bigger gravel of Morávka. Morávka River gradually started to fall dry for most of the year. The river stretch locked with sediments was no longer sufficient to transport flood water out of the area and problems with flood protection started on the Dlouhá řeka River at municipalities upstream of the locality.

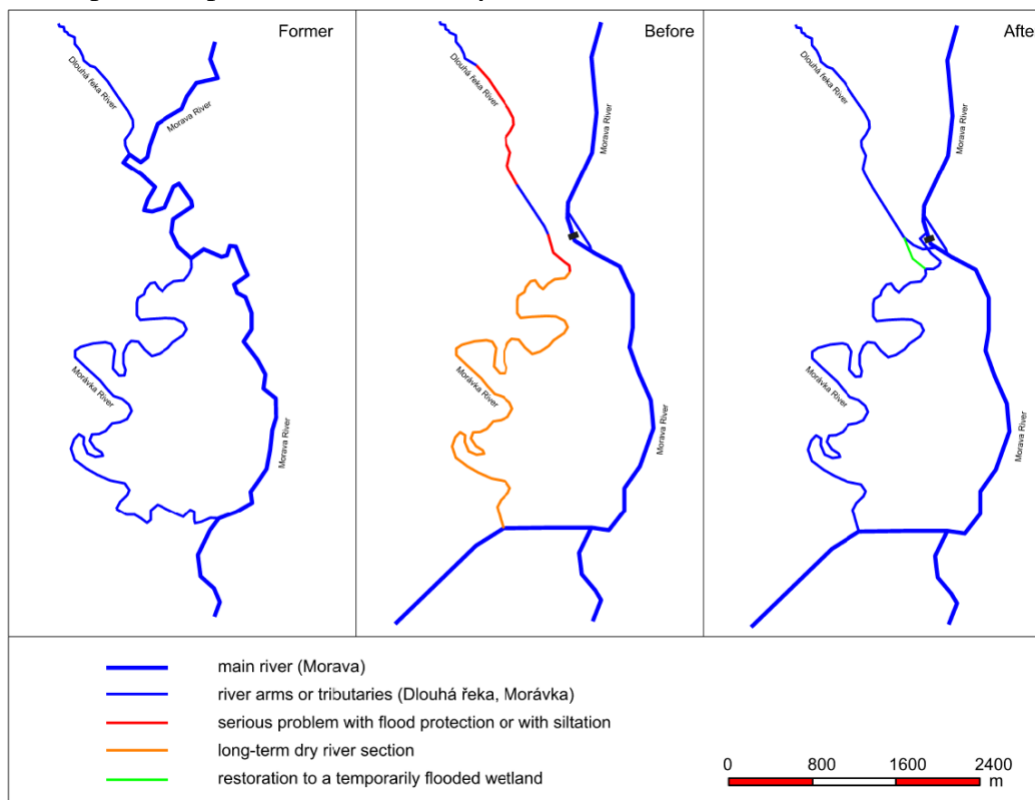

Figure 14: Historic (former), impacted (before) and restored situation (after) at the Nedakonice water management node

3.5.2 The measure

The aim of the revitalization measure is to ensure sufficient flow through the Morávka while at the same time limiting the entry of sediment from the Dlouhá řeka River into the system. Dlouhá řeka River will be taken downstream of the Nedakonice-weir. The new mouth of the Dlouhá řeka River will be created downstream of the weir ①. The solution also will have a positive effect on the runoff conditions in the village of Nedakonice. The fish migration passage on the Morava River will be ensured by a new fish pass ③. The water for the Morávka will be collected from the Morava River upstream of weir ② by a new channel. The solution will respect the requirements of the water regime of the floodplain and floodplain forest as well as the requirements of municipal flood protection. The solution restores a situation similar to the situation before water management and eliminates their negative impact. Only the siltation will

be removed from Morávka River ⑤, the rest of this river will be cleaned by river flow itself. The part of river bed, which will be no longer used for Dlouha řeka river ④, will be re-created to a temporarily flooded wetland.

The implementation of the measure is ongoing and is expected to be finished in 2021. The expected costs are around 3.2 mill. € (without VAT) which will be covered by EU and national funds.

Figure 15: Overview of the measure

3.5.3 Conclusion

The measure is expected to have a positive effect on the runoff conditions in the village of Nedakonice and migration passage on the Morava River. The solution will respect the requirements of the water regime of the valley floodplain and floodplain forest as well as the requirements of municipal flood protection. The solution restores a situation similar to the situation before water management and eliminates their negative impact. Dlouha řeka and Morávka River are connected directly to the Morava River again which restores their flow regime and increase their morphological condition. More than 7 km of previously dry river bed of Morávka River are restored to a functioning river with full discharge again. Consequently, the measure serves both, the EU WFD and the Habitats Directive.

Figure 16: Morava River and Nedakonice water management node (on the lower right side)

3.6 CZ-Bečva: Restoration of the Bečva River

3.6.1 Initial (impacted) situation

Naturally, the Bečva River was a wild gravel flowing stream, but in the last century it was gradually modified to a monotonous capacity channel with a profile of a simple trapezoid. The effort of the river for shore erosion was suppressed by repeated building interventions. Restrictions on shore erosion and natural gravel run have led to the acceleration of bottom erosion and the gradual decomposition of the flow channel.

Figure 17: Already restored section of the Bečva River

3.6.2 The measure

Until the extreme floods in 1997, there was a spontaneous renaturation of several sections. These sites have become inspiration for revitalization. At present, a four-kilometre natural river bed rehabilitation project is being prepared. The narrow trapezoidal riverbed will be transformed into a triple-walled gravel stream with a moving shallow cunette and a large expanse of exposed gravel. The project envisages the restoration of the morphological processes within the created river corridor, the restoration of the natural regime of the gravel sediment load and the improvement of the river's function during the floods.

The measure is still ongoing and the expected costs of 13,4 mill. € (without VAT) will be covered by EU and national funds.

3.6.3 Conclusion

Restorations in larger rivers should always consider impacts on the catchment scale. Often, problems arise at the tributaries (e.g. sediment deficit) and are consequently inherited by the Danube itself. Disturbed gravel flows, which form a significant part of the hydrographic network, represent a fundamental problem. One older project coined the name "gravel crown Danube" for them. Bečva is just one of the typical gravel streams. For this reason, the solution of its revitalization is an important stone in the mosaic of achieving good status of the entire Danube basin.

Figure 18: Revitalizing intervention implemented the “nature model” of spontaneous river renaturation

Figure 19: In some places it was necessary to correct the development of nature-friendly river bed interventions

3.7 CZ-Morava: Morphological restoration of the Morava River

3.7.1 Initial (impacted) situation

In the 1970s, the Morava River was heavily stabilized by stone riprap between the confluence with Cholinka River and “Štěpánovska smuha”. Nevertheless, it is still currently reported to exhibit unaffected flow conditions. Bank stabilization prevents lateral erosion processes and increases bottom erosion. The result is the unnatural recess of the river below the terrain of the surrounding floodplain (i.e. river bed incision). Although everything seemed fine at the first sight, it caused a significant deterioration of the morphological condition. This was unacceptable, especially because of the location in the Landscape Protected Area Litovelské Pomoraví.

Figure 20: Before the implementation of the action was necessary to obtain ownership rights to coastal land

3.7.2 The measure

To improve the situation, the heavy stone riprap will be locally removed along a 2.6 km long section of the Morava River. In order to reduce the transport of material inside the protected landscape area, this material will be reintroduced directly in the stream on site. Initial channelling elements (stone shoots, islands and bottom elements) combined with wood mass (anchored strains) will be created. The initiating elements in combination with the riverwood contribute to the decaying of the bank and accelerate the desirable morphological development that has long been unnaturally suppressed.

The measure itself is already finished and caused expenses of 160,976 € (without VAT). However, the purchase of land, which accounts for 742,115 €, makes up a large proportion of the overall costs.

Figure 21: Inappropriate bank lining were removed and used for initiation elements

Figure 22: Restored section of the Morava river with a man-made peninsula

3.7.3 Conclusion

If the revitalization is well done, human intervention on the river should not be noticeable. This applies here. The river again develops freely and increases its morphological value of protected landscape area. The whole area is better adapted to climatic change, the ability to better manage water supplies is improved. The measure supports the achievement of the EU WFD. However, the restoration measure is also expected to have a positive effect on the Habitats- and Birds Directive (Litovelské Pomoraví”; EVL CZ0714073, CZ0711018).

3.8 RO-Somes Mic: Restoration of connectivity in the Somes Mic River

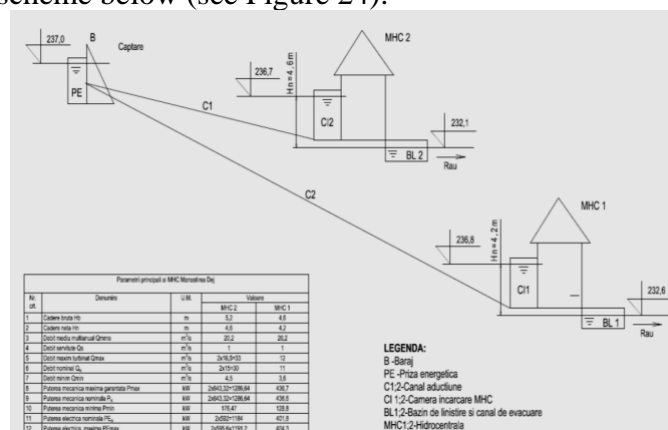

3.8.1 Initial (impacted) situation

The Manastirea River Dam is located on the river Someșul Mic, at a distance of approx. 3.5 km from the confluence with Someșul Mare river, on the territory of Mănăstirea locality, upstream of Dej municipality.

Figure 23: Location scheme- Monastery dam

The river dam and the hydropower plants were built a century ago, in the place where there used to be a water mill. Thus, in 1910, the Monastery was the first electrified rural locality in Eastern Europe. The current purpose of the river dam is the water intake for hydropower production in the hydropower plants (HPP) Manastirea 1 and 2, according to the planning scheme below (see Figure 24):

Characteristics

- $P_{installed} = 0.8 \text{ MW}$,
- $V_{turbined} = 168.16 \text{ mill. m}^3/\text{year}$
- Energy produced = 5.91 GWh/year.
- The maximum flow that can be transited through the arrangement section is $138\text{m}^3/\text{s}$.
- Main features of the dam:
 - dam length = 47.6 m
 - dam elevation = 238 m above sea level
 - dam height = 4.5 m at the overflow ridge (7.5 m in total)

Figure 24: Planning scheme of HPPs Manastirea 1 and 2

Two small hydropower plants are included in the hydropower planning scheme, Dej Manastirea 1 and 2, located on the banks of the Someșul Mic river, on both sides of the dam.

The water body RORW2-1-31_B4 / Someșul Mic - cf. Nadăș -cf. Someș Mare, on which the dam is located, has been designated a heavily modified water body (typology RO05CAPM) due to the hydromorphological pressures and transversal barrieres (3 obstacles with a height >0.5 m).

3.8.2 The measure

The measure of equipping the dam with a fish pass facility has been established in the frame of River Management Plan of the Someș-Tisa hydrographic area, estimated to be implement in the period 2015-2021. The following considerations have been considered:

1. The presence of migratory fish species downstream of the transversal barrier and their absence at the upstream monitoring sections. The monitoring of the quality element (QE) fish, performed in 2020, indicated the presence of migratory species nase (*Chondostroma nasus*), barbel (*Barbus barbus*) and vimba bream (*Vimba vimba*) in the monitoring section located after the confluence with Someș Mare river.
2. According to the distribution of the ichthyofauna in Romania (after Bănăreșcu, 1964), on the respective segment of the river the barbel (*Barbus barbus*) is indicated as the dominant species.
3. The dam is located in a site of community importance (ROSCI0394 Someșul Mic) which was designated in 2011. Three fish species can be found on the list of protected species within this site.
4. An acceptable level of implementation costs, compared to environmental benefits.

Figure 25: Construction scheme / Photo - fish pass

In the period 2015-2017, the measure was implemented, together with the rehabilitation works of the dam, hydroelectromechanical equipment and HPP made by the new owner of the dam. The fish pass is located on the left bank of the dam with a total length of 28 m, the upstream level is 236.25 m above sea level, and the downstream is 230.0 mdMN. The flow through the fish pass is 1 m³/s. Constructively, it consists of a system of pools with a size of 1.20x1.40 m, located at different heights and communicating through slots with a size of 20x60 cm. The thickness of the walls of the pools is 30 cm. The project was funded by Someș Tisa RB Administration budget. The total costs of the measure have been 38.000 €.

3.8.3 Conclusion

Following the monitoring of the ichthyofauna on the water body RORW2-1-31_B4 / Someșul Mic -cf. Nadas-cf. Someș Mare carried out by the laboratory of the Someș-Tisa hydrographic space in 2020, in the upstream section of the Manastirea dam, *Barbus barbus* were identified,

which indicates a properly functioning of the fish pass. The fish migration route was thus extended by 20.4 km.

Also, when monitoring the biological elements carried out by the owner of the small hydro power plant, according to the obligations contained in the water management permit, specimens belonging to the species *Barbus barbus* were caught, even in the fish pass.

Figure 26: Photo Collage - MHC fish fauna monitoring (source: SC Limnades LLC)

In the 3rd planning cycle of the RBMP, works for restoring the longitudinal connectivity on the water body RORW2-1-31_B4 are foreseen for another two transversal barriers, in the area of Gherla and Apahida localities. The implementation of these measures will lead to the complete restoration of longitudinal connectivity on this water body.

3.9 HU-Tisza: Measures to improve water retention in Bereg

3.9.1 Initial (impacted) situation

The landscape unit Bereg (579 km² in total) is located in Hungary and Ukraine. In Hungary 54% of the area is nature protected by Hungarian laws and/or part of Nature 2000. The area is situated between the Carpathians and the Tisza river which is flowing at the borders of Nyírség, a sandy hilly area. The area is typically characterised by small settlements having declining birth-rate and aging population.

Before river restorations, Bereg used to be an area of little waters; creeks running from the mountains, and swamps situated between these creeks. The mosaics of this landscape are still to be found and stand under nature protection.

The flood protection management technics since the 1870s of the river Tisza, the irrigation and land use changes formed the water system of the area. The floodplain became disconnected from its main river and the creeks channelized. New drainage and irrigation channels were built which do not necessarily follow the former river beds. The onetime wetlands are often under agricultural use, where water still appears in form of excess water. On average 26% of the area is affected by excess water. Maximal excess water inundation is affecting 44% of the area. It can also be mentioned that the area is within drought zones of medium and high intensity. The excess water channels are 935 km long in Bereg.

Figure 27: Original river system

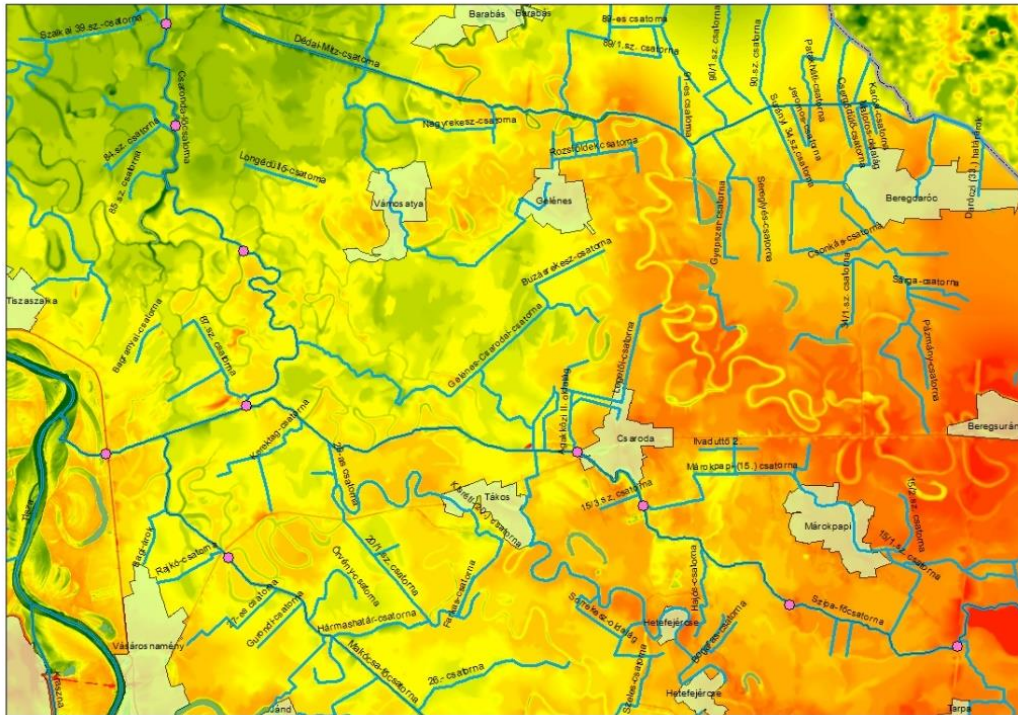

Figure 28: Drainage channels

The river regulations resulted in less water in the area, as swamps were drained, creeks abolished and new channels constructed also with the aim to drain the land. Excess water is regarded as a problem on the agricultural land. Climate change, the need for agricultural production and nature protection aims changed the relation to water, which is not regarded as part of the landscape.

The water managing structures of the area are mainly suitable for the drainage of water and not for managing/ retaining it. Furthermore, the agricultural use not fully takes into account the water regime characteristics of Bereg, which makes the agricultural production vulnerable. Nature protection is of high importance in the area, but is also not fully sustained by the existing water infrastructure.

The restoration aimed to change the water infrastructure to better accommodate it to landscape characteristics (small creeks, more water) and to make a land use change possible.

3.9.2 The measure

The Bereg project aimed to raise water retention possibilities by ensuring more water in the area and helping better water regulation. The concrete measures involve two new water abstraction possibilities from the river Tisza, three new channels for water supply, channel rehabilitations, building/reconstruction of structures to ensure water retention, rehabilitation of former mine pits to create wetlands as also building/modernisation of new monitoring stations. Also, a water supply possibility was analysed from the Borzsa river in Ukraine.

The creation of water retention possibilities has multiple effects:

- it sustains the water supply of dead arms and backswamps in Bereg
- landscape management can be now based on the concept of water retention. More water is available in the area in low water situations, it also sustains the quality of available water resources

- the new infrastructure ensures the basis for an optimal land use for e.g. forestry, nature protection, agriculture. It adumbrates the improvement of the environmental status of the area but also farmers' living conditions.
- landscape management can be attached to the function of overflow reservoirs. Two overflow reservoirs of the river Tisza are situated in Bereg. In case of high floods, the reservoirs will be able to transfer water to Bereg.
- Monitoring system (also structure operation monitoring) development in the area ensures the continuous information on water quality and quantity.

The project was finished in 2019. The overall costs of 34 mill. € were entirely covered by EU funds.

3.9.3 Conclusion

The project was initiated by foresters, nature protection experts, farmers and water managers. It was a good example for stakeholder participation where the change of water management principles was originating from local residents and farmers.

More water in the area enables higher groundwater levels. During arid summer periods forests and agricultural land benefit from available groundwater as also protected water dependent wetlands do. It makes the change in land use possible that fits more to landscape characteristics. The project is beneficial for the EU WFD, Habitats directive and the European Landscape Convention and has connection to FD. Hungary built overflow reservoirs which intended to be multifunctional. By retaining water from floods/ excess water the water can be used for other aims as nature protection, landscape unit characteristic based agriculture. The project builds on the overflow reservoirs as also on other water resources (Tisza, Borzsa) by using a holistic view.

Figure 29: Restored section

3.10 HU-Monsoni-Duna: Measures at Mosoni-Duna estuary section

3.10.1 Initial (impacted) situation

Szigetköz is situated in north-western Hungary and depends on Danube water. This river stretch still shows the anabranching pattern of the Danube, while the river branches are already stationary. The regulated water levels and transfers are ensuring this situation. Still, this area has high values in nature protection, landscape management and recreation. The Szigetköz with its water dependent habitats is representing a unique value.

Szigetköz is depending on the water transferred from the Gabčíkovo reservoir on the Danube. After the building of the HPP the arms of the anabranching river lost water. Several measures have been taken since 1992 on the Hungarian side to reduce the impacts of less water, mainly smaller and larger dams/ weirs were built to ensure water retention in the side arms.

Since the 1960s, the Danube is suffering from river bed incision, as a consequence of HPPs and river regulation in Germany and Austria.

The river bed incision of about two meters has a suction effect on the Szigetköz side arms and the groundwater. The dam newly built at the mouth of the Mosoni-Duna arm is situated on the lowest point of the area, where the anabranching character ends. It helps to sustain water retention on the lower part of the area (the mitigation measures started on the upper part of Szigetköz and continued on the middle part while the lower part was less taken into account until now).

Figure 30: Project area (confluence of Mosoni-Duna with Danube)

3.10.2 The measure

The main aim of the project was to raise the medium and low water levels in the lower section of Mosoni-Danube and the connected area of Szigetköz, but also to restore the estuary water level corresponding to the supporting effect of the Danube. It was realised by the building of a new dam at the mouth of Mosoni-Duna.

The higher water levels in the lower Szigetköz will enable water supply for wetlands and floodplains in Szigetköz where the former Danube branches have important values with their colourful ecosystems.

Figure 31: Before the construction works started at Mosoni-Danube and Danube estuary section

Figure 32: Construction works – funding the structure

The building of the dam also sustains other water uses. Higher water levels ensure navigation of the Mosoni-Duna: The Győr-Gönyü national port –built from 1992 – and situated near the mouth of Mosoni-Duna will be better available for ships due to higher water levels. Also, the results of the project will provide a more attractive view of the city Győr, where river bed incision also indicated changes. The dam will also ensure the exclusion of too high water levels of the Danube reducing the flood risk of the cities along the lower Mosoni-Duna. The project is ongoing and expected to be finished in 2021. The overall costs of 82 mill. € will be shared between EU (50%) and national funds (50%).

3.10.3 Conclusion

The new dam raises the medium and low water levels and ensure higher water levels in lower Szigetköz. This higher water level will be adjusted to original water levels (before the HPP was built and the Danubean incision reduced water levels here), while ecosystem needs will be

considered. It will enable better water supply of river branches, wetlands and floodplains, and connect their woody and water related ecosystems. The main aim is to have a more natural conditions in this area. The measure serves the EU WFD by reducing the risk of low water situations in Szigetköz (and reaching good status) as also Floods Directive by increasing the flood safety for the city Győr. Furthermore, the Fertő-Hanság National park under the name Szigetközi Landscape Conservation Area and the Natura 2000 site as Szigetköz (HUFH30004) may benefit from the measure.

3.11 SI-Continuity restoration in the Sava River

3.11.1 Initial (impacted) situation

There are 8 HPPs built on the Slovenian part of the Sava River. Between the most downstream HPPs there is an additional dam that is needed for operation of a nuclear power plant. Fish passes are built on the three most downstream HPPs. With construction of the last HPP also the dam at the nuclear power plant becomes passable for fishes due to an increase in water level caused by the downstream HPP. The construction of a fish pass is one of numerous mitigation measures on the HPP. There were also other mitigation measures implemented, i.e. dynamic river banks, sand banks for kingfishers, floating islands for terns, banks for sand martins, riparian vegetation, passages for amphibians, passability between Sava River and tributaries etc.

3.11.2 The measure

The fish pass is located on the run-of-river HPP Brežice, on the left bank of the Sava River. The fish pass is divided in two parts – first, a near-natural part, designed as a side channel of the river and second, a technical part, designed as sequence of pools. The first part is 830 m long and is created as meandering channel with two larger resting places, five spawning grounds, six larger pools and nine sequences of rapids. Special attention was given to designing of spawning grounds, where specific river conditions are needed (water depth, flow velocity and substrate). These spawning grounds are mainly designed for following fish species: *Chondrostoma nasus*, *Rutilus pigus virgo*, *Squalius cephalus*, *Barbus barbus* and *Alburnoides bipunctatus*.

Figure 33: HPP Brežice and the fish pass on the Sava River after construction

At the inflow to the technical part of the fish pass, an automatic system of one main lock and six regulative locks enables inflow of the necessary discharge for every water level condition. The water flow in the fish pass is changing depending on the fish species needs in each particular season of the year. There is a higher discharge guaranteed in spring (800 l/s) during spawning season. Also, in summer and early spring discharge is slightly higher (650 l/s) and then reduced in autumn and winter time (500 l/s).

Figure 34: HPP Brežice and the fish pass on the Sava River one year after construction

The operation of the fish pass was also adjusted to high water flow conditions (when discharge of Sava is higher than 700 m³/s). In these conditions the main lock is partially closed (7%), one of the regulative locks is opened and the other regulative locks are closed in order to guarantee a reduced inflow of suspended sediment into the fish pass and to prevent siltation in the fish pass. In high water conditions fishes are hidden in pools created within the fish pass.

The operation of the fish pass is also adjusted to winter conditions. In order to prevent freezing of water in the inflow part (when air temperature is lower than 3°C), only the first and sixth regulatory lock is opened.

3.11.3 Conclusion

After the fish pass construction in 2017, fish monitoring was established. Results showed appropriate functioning of the fish pass. In total, 27 different fish species were identified, whereby the near-natural part of the fish pass featured a higher diversity of fish species. It was found that fish species are present along the whole length of the fish pass.

The functionality of the fish pass depends mainly on guaranteed flow variability. This is of special importance for prevention of siltation of the substrate too that is crucial for effective spawning grounds. Beside this also regular maintenance works on the fish passes are recognised as very important for its appropriate working.

Figure 35: HPP Brežice on the Sava River 3 years after construction

4. Final remarks - Outlook

Most of the here presented lighthouse projects aim for the restoration of more than one impact type (e.g. hydrology, morphology, connectivity). Furthermore, most examples also serve the fulfilment of more than one directive (e.g. WFD, Habitats Directive, Birds Directive, Floods Directive). They therefore provide best-practice examples on how synergies can be used.

Four examples are located in the Danube River or in its vicinity. All of these projects focus on morphological restorations, while three also serve continuity restoration. Six examples are located in Danube tributaries. Since the Danube often inherits problems arising in tributaries (e.g. sediment deficit), restorations in tributaries are not only relevant locally but are beneficial for the Danube too in the long run.

The here presented lighthouse projects represent just an extract of many implemented measures in the DRBD between 2015 and 2021 (see Table 1). Since efforts to restore the Danube and DRBD tributaries will have to continue in the future, the here presented examples should provide some inspiration for future measure implementation.

Of course, several additional measures are planned for the DRBD. While several fish passes and river restoration projects are currently in planning or in construction phase, there are also additional measures planned for the period 2021-2027. With 211 measures, a clear focus is given to continuity restoration. But also 50 morphological and 25 hydrological restoration projects are foreseen. Finally, the reconnection of 30,845 ha of wetlands/floodplains are planned until 2027. Further exchange on their planning and implementation, the best use of synergies and contribution to fulfilment of the WFD are encouraged in order to make the best use of available resources.

5. Projects related to hydromorphology and supported by the ICPDR

Beside implemented hydromorphological measures, important progress in the field of hydromorphology in the Danube River Basin was made through the implementation of different projects supported by the ICPDR, mainly the DanubeSediment project, the Danube Floodplain project and the MEASURES project (on restoring corridors for migratory fish species), which results are presented in the DRBMP Update 2021.

Additionally, also other important projects, supported by the ICPDR, were implemented, including projects Aquacross (hydromorphological restoration, mitigation and conservation), coopMDD (restoration of ecological connectivity), DANUBEparksCONNECTED and WILDIslands initiative (Danube wild islands habitat corridor), DriDanube (management of drought related risks), FRAMWAT (small water retention measures) and MARS (managing of aquatic ecosystems) or are in implementation phase in the Danube River Basin, including projects Living Danube Partnership (rivers, floodplains and wetlands restoration), IDES (integrative floodplain management), LIFELINE MDD (restoration of ecological connectivity). Several of these projects like DriDanube, FRAMWAT, MARS or IDES are also of pollution relevance and supported and/or support ICPDR.

More information about the projects, including a short description and weblinks, can be found in the table below.

Name of the project	Duration	Aim/results of the project with particular relevance for HYMO activities/objectives	Web page
AQUACROSS: Knowledge, Assessment and Management for AQUatic Biodiversity and Ecosystem Services aCROSS EU policies	2015-2019	An assessment of pressures on inland waters was performed identifying the extent of hydromorphological alterations, and specifically for the Danube River Basin a prioritisation of the river-floodplain systems along the navigable stretch of the Danube for hydromorphological restoration, mitigation and conservation was conducted. Therefore, a novel integrative modelling approach was developed that used different data sets (including hydromorphological assessments) and considered multiple targets related to biodiversity, ecosystem services and socio-economic benefits, in line with Ecosystem-based management.	https://aquacross.eu/
Coca Cola Living Danube Partnership	2014-2021	Regional partnership between WWF, COKE system and ICPDR covering river and floodplain, wetland restoration projects across six countries (Austria, Hungary, Croatia, Serbia, Romania and Bulgaria). The partnership is working closely with local stakeholders and relevant authorities to restore areas and connect river stretches or , incl floodplains to the river system by opening dams, reconnect side-arms, installing water retention artefacts, improving water supply channels, forest habitats or creating open water surface. At the same time regional movement is being created for river, wetland conservation and restoration.	https://www.icpdr.org/main/publications/working-together-living-danube
coopMDD	2017-2019	In the frame of the coop MDD project, a Transboundary Management Programme for the future 5-country UNESCO Biosphere Reserve "Mura-Drava-Danube" (TBR MDD) was jointly developed. The "Guidelines for a dynamic river corridor" as one of the project outputs show which objectives need to be reached to protect and restore the dynamic river corridor for the rivers Mura, Drava and Danube, also with regard to "River management and engineering".	https://www.wwf.at/de/coopmdd/
DANUBE parks CONNECTED: Bridging the Danube Protected Areas towards a Danube Habitat Corridor	2017-2019	Within DANUBE parks CONNECTED (funded by the Interreg Danube Transnational Programme), the Danube River Network of Protected Areas (DANUBE PARKS) implemented transnational measures to counteract habitat fragmentation, and to strengthen the Danube as ecological corridor. The WILD island initiative has been launched: Based on a Danube-wide inventory of all islands, the conservation campaign for these "flagship sites of river dynamics" resulted in pilot river restoration measures. Additionally, project actions preserved and restored riparian soft wood forests, promoted coherent management of Danube dry habitats, and protected thousands of bird lives against collision at electric powerlines (DANUBE FREE SKY initiative).	www.danubeparks.org http://www.interreg-danube.eu/

Name of the project	Duration	Aim/results of the project with particular relevance for HYMO activities/objectives	Web page
DriDanube	2017-2019	The project aimed at increasing the society's resilience to the occurrence of drought in the Danube region by developing a regional drought monitoring tool ¹ and a strategic document on improved national response to drought ² . The project results with particular relevance for HYMO activities/objectives is the drought monitoring tool "Drought Watch", developed for better drought characterisation and early warning over the region by allowing a spatial and temporal view of the state of soil moisture and vegetation through various drought-related datasets at regional and national level. The tool integrates also the results of the project-established "National Reporting Networks" in 10 Danube basin countries, which gather weekly observations on the state of soil and plants, and this way help deliver early awareness of drought damage in place. The other product of this project, also integrated into Drought Watch, are informative cross-border comparable maps of drought risk in the Danube region, prepared both in climatological sense and in relation to expected yield loss. They allow to recognise the areas prone to rainfall deficit or considerable crop losses.	http://www.interreg-danube.eu/approved-projects/dridanube ¹ https://droughtwatch.eu/ ² http://www.interreg-danube.eu/uploads/media/approved_project_out_put/0001/38/0363f7bdde74184f0f372bc04744650d46445c49.pdf
FramWat: F ramework for improving water balance and nutrient mitigation by applying small w ater retention measures	2017-2020	The main aim of the FramWat project was to support and boost knowledge on more systematic approaches towards the application of N(S)WRM in river basins. One of the main tools developed within the project is FroGIS – GIS based tool to analyse the needs and possibilities of water retention. The rest of the tools and outputs developed within the project, best practices from participating countries, and practical recommendations from pilot catchments are collected into 5-step process of N(S)WRM planning and presented in the Practical Guidelines on Planning Small Water Retention in River Basins. Addition to the Guidelines is the Decision Support System, created for people involved in planning water retention measures. The goal of the application is to familiarise the user with the catalogue of N(S)WRM and the planning process, as well as to survey their preferences for their area of interest.	www.interreg-central.eu/FramWat http://WaterRetention.sggw.pl https://www.interreg-central.eu/Content.Node/DT353-Guidelines.pdf https://planning.waterretention.sggw.pl/
IDES: I mproving water quality in the D anube river and its tributaries by integrative floodplain management based on E cosystem S ervices	2020-2022	IDES aims to identify the retention potential of floodplains by applying the model MONERIS and to integrate multiple interests along the river to accelerate the joint implementation of a sustainable water quality management along the Danube. The new IDES tool will help to derive optimized, nature-based solutions by assessing all relevant ecosystem services in an unbiased way, their trade-offs and synergies. Based on the results of Danube wide assessment and in pilot areas, national action	http://www.interreg-danube.eu/ides

Name of the project	Duration	Aim/results of the project with particular relevance for HYMO activities/objectives	Web page
		plans with prioritized areas and a joint strategy for improving water quality at transnational level will be developed regarding the Danube river basin management plan and targets of PA4 and PA6 of the EUSDR.	
lifelineMDD	2020-2022	The project lifelineMDD addresses the issue of an insufficient knowledge base and unused synergies within the transboundary MDD river corridor with a cross-sectoral partnership that aims to improve connectivity and biodiversity. The development of a strategic integrated approach to river restoration will be based on scientific studies of bio-indicators (fish and river birds) and abiotic framework conditions (sediment transport and climate change). A cross-sectoral learning process between nature protection and water management authorities based on pilot restoration actions will raise institutional competences and cooperation between key stakeholders.	http://www.interreg-danube.eu/approved-projects/lifelinemdd http://www.amazon-of-europe.com/en/lifelinemdd/ https://www.wwf.at/de/lifeline-mdd/
MARS: Managing Aquatic ecosystems and water Resources under multiple Stress	2014-2018	Aim/results of the project with particular relevance for HYMO activities/objectives (2-3 sentences): MARS has analysed data from various spatial scales, i.e. local water body, single river basin and European scale, in order to better understand and disentangle complex interactions between pressures (including HYMO), resulting stressors and their effects on aquatic biota. Multi-stressor situations require knowledge on the relative importance of different stressors (stressor hierarchy, including dominating stressors) and their impacts in order to find the best combination of mitigation or restoration measures. MARS therefore has generated a general framework supported by MARS tools for tackling multi-stressor conditions in River Basin Management and to select appropriate management strategies concerning the level and type of necessary mitigation measures, which are described in the MARS Recommendations document.	http://www.mars-project.eu https://freshwaterblog.net

DISCONNECTED WETLANDS AND FORMER FLOODPLAINS WITH POTENTIAL FOR RECONNECTION

ANNEX 20

Disconnected wetlands and floodplains listed below are collected considering criteria given in the Table.

Disconnection of adjacent wetlands/floodplains, provoked alterations and criteria for the significant pressure assessment

Morphological pressure	Provoked alteration	Criteria for significant pressure assessment
River regulation works Intensive land use within riparian and adjacent land	Alteration of adjacent wetlands/floodplains	All disconnected wetlands/floodplains >500 ha and smaller ones of basin-wide significance, with a definite potential for reconnection or with potential for improvement of lateral connectivity within the active wetland/floodplain

Explanation of abbreviations for the tables

AWB = Artificial Water Body

HMWB = Heavily Modified Water Body

NWB = Natural Water Body

RWB = River Water Body

FINANCING JOINT PROGRAMME OF MEASURES

ANNEX 21

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
European Regional Development Fund (ERDF)	EU (European Structural and Investment Funds/ ESIF)	The ERDF aims to strengthen economic, social and territorial cohesion in the EU by correcting imbalances between regions. The ERDF supports regional and local development to contribute to all of the thematic objectives, laid down in the CPR ¹ .	<p><u>TO 5 (climate change adaptation, risk prevention and management):</u> ecosystem-based approaches for hydromorphological alterations (reconnection of wetlands/floodplains), possibly nutrient pollution (diffuse pollution from agriculture).</p> <p><u>TO 6 (preserving and protecting the environment and promoting resource efficiency):</u> organic pollution (UWWTP, industrial point sources), nutrient pollution (UWWTP, industrial point sources), hazardous substances pollution (UWWTP industrial point sources), hydromorphological alterations (reconnection of wetlands/floodplains).</p> <p>The TOs are accompanied by five specific objectives (POs), of which PO2 is of special importance for environmental issues: “a greener, low-carbon Europe by promoting clean and fair energy transition, green and blue investment, the circular economy, climate adaptation and risk prevention and management²”</p>	<p>Only EU Member States eligible</p> <p>MS/regions are classified according to “more developed regions/transition regions/less developed regions” (influencing minimum allocations set for a number of priority areas, such as “low carbon economy”).</p>	<p>*Common Provisions Regulation³.</p> <p>*ESIF general: http://ec.europa.eu/contracts_grants/funds_en.htm</p> <p>*ERDF general: https://ec.europa.eu/regional_policy/en/funding/erdf/</p> <p>*Project database: http://ec.europa.eu/regional_policy/index.cfm/en/projects/?LAN=EN&pay=ALL&region=ALL&the=97&type=ALL&per=2</p>
European Social	EU (European)	The European Social Fund Plus (ESF+) is the main	No direct linkage to the Danube SWMIs.	Organisations based in EU Member	*Common Provisions Regulation

¹ The thematic objectives, applicable to all ESI Funds, are: 1. research and development, and innovation; 2. information and communication technologies; 3. competitiveness of SMEs; 4. shift towards a low-carbon economy; 5. climate change adaptation, risk prevention; 6. protecting the environment and promotion resource efficiency; 7. promoting sustainable transport; 8. employment and labor mobility; 9. social inclusion and poverty; 10. education, and training; 11. institutional capacity and efficiency of public administration.

TO 5 and 6 are particularly relevant for water and marine policy.

² Proposal for a REGULATION OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL on the European Regional Development Fund and on the Cohesion Fund: <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM%3A2018%3A372%3AFIN>

³ More detailed information on eligibility, financial instruments, ex-ante conditionalities and management and control principles, as well as common elements on strategic planning and programming, thematic objectives linked to the Europe 2020 Strategy and visions on the Common Strategic Framework and on the Partnership Agreements to be agreed between the Commission and each Member State can be found in the Common Provisions Regulation/CPR (No 1303/2013 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 17 December 2013, amended 24th April 2020), to be found here: <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:02013R1301-20200424>.

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
Fund Plus (ESF+)	Structural and Investment Funds/ ESIF)	financial instrument to strengthen Europe's social dimension, for investing in employment opportunities (especially of young people), better education, improvement of the situation of the most vulnerable people; capacity building/training in the environment is also being supported.	Possible indirect linkages in all areas regarding capacity building/training.	States, associated countries and under certain conditions third countries are eligible for funding.	(see footnote 3 above) *ESF/ESF+ general: https://ec.europa.eu/esf/home.jsp?langId=en *Project database: see link under ERDF
Cohesion Fund (CF)	EU (European Structural and Investment Funds/ ESIF)	The Cohesion Fund 2021-2027 invests in all regions, still on the basis of 3 categories (less-developed; transition; more-developed), determined by Gross National Income (GNI) and GDP/capita. New criteria are youth unemployment, low education level, climate change, and the reception and integration of migrants.	<u>TO5 and 6 of the CPR as well as the new PO2 apply to the CF (see footnote 2):</u> - <u>Climate change adaptation and risk prevention:</u> hydromorphological alterations (reconnection of wetlands/floodplains). - <u>Investment in the water and waste sectors, and the urban environment:</u> organic pollution (UWWTP, industrial point sources), nutrient pollution (UWWTP, industrial point sources, urban run-off), hazardous substances pollution (UWWTP, industrial point sources, urban run-off). - <u>Investment in energy, provided it has positive environmental benefits:</u> possibly all hydromorphological pressures if linked to hydropower.	Only EU Member States eligible	*Common Provisions Regulation (see footnote 3 above) *CF general: https://ec.europa.eu/regional_policy/en/funding/cohesion-fund/ *Project database: see link under ERDF
European Maritime and Fisheries Fund (EMFF)	EU (European Structural and Investment Funds/ ESIF)	The EMFF is the primary financing instrument for the reformed Common Fisheries Policy (CFP) and the Integrated Maritime Policy (IMP), including the Marine Strategy	No direct linkage to the Danube SWMIs. Possible indirect linkages in transitional/coastal water, e.g. with regard to data collection on fish species, or the management, restoration and monitoring of coastal Natura2000 sites.	Only EU Member States eligible	*Common Provisions Regulation (see footnote 3 above) *EMFF general: https://ec.europa.eu/fisheries/cfp/emff/

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
		Framework Directive (MSFD). It is aimed at supporting the European fisheries sector towards more sustainable fishing practices, with a particular focus on supporting small-scale fishermen.	A new focus in 2021-2027 is on protecting marine ecosystems with an expected contribution of 30% of its budget to climate change mitigation and adaptation, in line with the commitments agreed under the Paris Agreement.		
CAP/ European Agricultural Fund for Rural Development (EAFRD)	EU (European Structural and Investment Funds/ ESIF)	The EAFRD is one of the primary financing instruments for the Pillar II of the CAP (Rural Development). The post 2020 CAP (whose budget is allocated for the multiannual financial network 2021-2027 but the provisional start date of the proposed CAP reform is 1 January 2023, with a transitional regulation for the period of 2021-2022) is proposed to be implemented through national CAP Strategic Plans, a programming tool that will define, for each Member State, the key parameters for the implementation of all CAP instruments (direct payments, rural development and sectorial interventions). The CAP Strategic Plans will be bound to conditionalities, e.g. in the field "climate and environment".	SWMI targeted through Pillar II payments (rural development), which will continue to fund investments also in the field of environment and climate. This includes the agri-environment-climate payments supporting environmental-friendly farming methods and practices beneficial for the environment and climate, and providing environmental public goods in the fields of climate change mitigation and adaptation, the protection and improvement of the environment, including water quality and quantity, air quality, soil, biodiversity, landscapes and ecosystem services. Hence, all SWMIs (except hydromorphology) and cross-cutting issues are also in future potentially covered by EAFRD payments. Additionally, rural development will continue to support organic farming, areas composing the Natura 2000 EU network, and also environment/climate-related investments, knowledge-building, innovation as well as co-operation.	Only EU Member States eligible	*Common Provisions Regulation (see footnote 3 above) *EAFRD general: https://ec.europa.eu/info/food-farming-fisheries/key-policies/common-agricultural-policy/rural-development#eafrd *CSWD on the proposed CAP and the environment: https://ec.europa.eu/info/sites/info/files/food-farming-fisheries/sustainability_and_natural_resources/document/analysis-of-links-between-cap-and-green-deal_en.pdf
LIFE	EU	The LIFE programme is the	Potentially addresses all SWMIs through the "LIFE	EU and non-EU countries	*General information:

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
		<p>only EU fund entirely dedicated to environmental and climate objectives. It supports the implementation of relevant EU legislation and the development of key policy priorities, by co-financing projects with European added value. In June 2018, the European Commission submitted a proposal on a regulation establishing a new LIFE programme for 2021-2027. It has two main fields of action, covering four sub-programmes. 1: Environment field with the Nature and Biodiversity and the Circular Economy and Quality of Life sub-programmes. 2: Climate Action field with the Climate Change Mitigation and Adaptation and the Clean Energy Transition sub-programme.</p>	<p>Integrated Projects" (organic pollution indirectly). Foci are ecosystem-based approaches: organic pollution (indirectly through natural buffer zones), nutrient pollution (diffuse sources from agriculture and agricultural atmospheric emissions, urban run-off), hazardous substances pollution (diffuse sources, mainly from agriculture, but potentially also from urban and landfill/mining sites), hydromorphological alterations (longitudinal river continuity, reconnection of wetlands/floodplains, hydrological alterations).</p> <p>Also measures targeting sediments (retention measures) and IAS.</p> <p>Through the many links to climate and resilience, synergy effects between climate change adaptation, mitigation and water/biodiversity protection are manifold (keywords: NWRM, green infrastructure).</p>	<p>(candidate countries and the Western Balkan countries involved in the Stabilisation and Association Process, as well as countries to which the European Neighbourhood Policy applies).</p>	<p>http://ec.europa.eu/environment/life/ *Information on COM proposal: https://www.europarl.europa.eu/RegData/etudes/BRIE/2018/628294/EPRS_BRI(2018)628294_EN.pdf *LIFE regulation (proposal): https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=COM%3A2018%3A385%3AFIN *National contact points: https://ec.europa.eu/easme/en/section/life/life-national-contact-points</p>
Horizon Europe	EU	Horizon Europe is the funding program for research and innovation for the period 2021-2027.	No direct link to Danube SWMIs, but research to support measures/knowledge on any SWMI is possible.	EU and non-EU countries (associated countries). Research program, SME participation possible. Most projects require at	*General information on Horizon Europe: https://ec.europa.eu/info/horizon-europe-next-research-and-innovation-framework-

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
				least three partners.	programme_en
INTER-REG VI/ European Territorial Cooperation (ETC)	EU	INTERREG programs are a specific strand of funding possibilities within the cohesion policy funding, under the European Territorial Cooperation (ETC) goal. INTERREG programs typically focus on cooperation between regions and Member States, and are generally aimed at enabling exchange of experience, knowledge and good practices among relevant stakeholders from different MS and/or regions.	No direct link to Danube SWMIs, but enabling exchange of experience, knowledge and good practices can benefit implementation of measures in all areas.	EU and non-EU countries. Programs can be cross-border (along internal EU borders), transnational (cover larger areas of cooperation such as the Danube Basin), and interregional at EU-28 level (between regional and local bodies in different countries belonging also to different regions).	*Information on Interreg VI (legislative process): https://www.europarl.europa.eu/RegData/etudes/BRIE/2018/628228/EPRS_BRI(2018)628228_EN.pdf *Information on ETC and INTERREG V: http://ec.europa.eu/regional_policy/index.cfm/en/policy/cooperation/european-territorial/ *Project database: http://ec.europa.eu/regional_policy/index.cfm/en/projects/?LAN=EN&pay=ALL&region=ALL&the=97&type=ALL&per=2 List of programs: http://www.danube-region.eu/2014-03-21-07-28-38/etc-ipa-etc-and-enpi-etc-programmes
Neighbourhood, Development and International Cooperation	EU	NDICI (replacing ENI) is providing direct financial support for the EU's external actions.	Support for non-EU countries participating in cross-border ERDF/INTERREG programs possible.	Non-EU (candidates, possible candidates and neighbouring countries; in	*General information on the new policy (proposal): https://www.europarl.europ

Financing Program	Organization	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
tion Instrument (NDICI)			Otherwise, potential link to Danube SWMIs through various funding opportunities (in July 2020, not yet adopted).	the Danube region: Republic of Moldova and Ukraine)	a.eu/RegData/etudes/BRIE/2018/628251/EPRS_BRI(2018)628251_EN.pdf *Proposal for the new regulation: https://www.europarl.europa.eu/RegData/docs_autres_institutions/commission_europeenne/com/2018/0460/COM_COM(2018)0460_EN.pdf
Instrument for Pre-Accession Assistance (IPA III)	EU	Since 2007, the Instrument for Pre-Accession Assistance (IPA) replaces a series of EU programs and financial instruments for candidate countries or potential candidate countries (such as PHARE, ISPA, SAPRD etc.). It is organized along five components, which are: C1. assistance for transition and institution building; C2- cross-border cooperation (with EU MS and other countries eligible for IPA); C3. regional development (transport, environment, regional and economic development); C4. human resources (strengthening human capital and	In the Danube RB, only C1 and C2 are being funded: 1. assistance for transition and institution building; 2- cross-border cooperation (with EU MS and other countries eligible for IPA). Hence, no direct link to Danube SWMIs, although institution building and cross-border cooperation can benefit implementation of measures in all areas.	EU candidate countries (Turkey and FYROM) are eligible for all five components of IPA, potential candidate countries in the Western Balkans (Albania, Bosnia and Herzegovina, Montenegro, Serbia, and Kosovo under UN Security Council Resolution 1244/99) are eligible only for the first two components.	*Information on IPAIII: https://ec.europa.eu/regional_policy/de/2021_2027/ *More general information: http://www.welcomeurope.com/european-funds/ipa-ii-instrument-pre-accession-assistance-2014-2020-838+738.html#tab=onglet_details *More information: http://ec.europa.eu/regional_policy/index.cfm/EN/funding/ipa/List_of_programs : http://www.danube-region.eu/2014-03-21-07-28-38/etc-ipa-abc-and-enpi-

Financing Program	Organisation	Description	Significant Water Management Issue targeted	Other eligibility criteria	Sources/ further information regarding application
		combating exclusion); C5. rural development.			cbc-programmes
International Bank for Reconstruction and Development (IBRD)	World Bank (WB)	The World Bank is an international financial institution that provides loans to developing countries. It consists of two agencies (IBRD and IDA) and focuses on the following fields: - human development (e.g. education, health); - agriculture and rural development (e.g. irrigation and rural services); - environmental protection (e.g. pollution reduction, establishing and enforcing regulations); - infrastructure (e.g. roads, urban regeneration, and electricity); - large industrial construction projects; - governance (e.g. anti-corruption, legal institutions development). The IBRD and IDA provide loans at preferential rates to member countries, as well as grants to the poorest countries.	No direct link to Danube SWMIs, although a multitude of projects/measures benefitting WFD implementation can be financed by WB loans (see also the examples listed under GEF).	IBRD: middle income and creditworthy low-income countries (all Danube except DE and AT). IDA: Republic of Moldova (and Kosovo)	*Products and Services: http://www.worldbank.org/en/projects-operations/products-and-services *IBRD: https://www.worldbank.org/en/who-we-are/ibrd *IDA: https://ida.worldbank.org/
International Development Association (IDA)			It has to be remarked, however, that IBRD provides only loans (though at preferential rates), not grants. IDA also provides grants.		
Global Environment Facility (GEF)	GEF	The Global Environment Facility is a partnership for international cooperation where 183 countries work together with international institutions, civil	GEF provides grants to various types of projects (Climate Change Adaptation Projects and Small Grants Programme (SGP) most relevant) ranging from several thousand dollars to several million dollars. Projects are supported in several "focal	Most countries should be eligible, depending on the focal area, eligibility criteria established	*Templates and guidelines available at: http://www.thegef.org/gef/guidelines_templates *Project types:

		society organizations and the private sector, to address global environmental issues.	areas", of which the most relevant are: Biodiversity, Climate Change, Chemicals and Waste. Financing is provided through grants and non-grants. Funding possible with regard to all Danube SWMIs.	by the relevant COP of the respective convention, and some others.	http://www.thegef.org/gef/project_types *Example from Republic of Moldova: http://www.worldbank.org/projects/P075995/agricultural-pollution-control-gef-project?lang=en&tab=overview *Example from Romania: http://www.worldbank.org/projects/P093775/romania-integrated-nutrient-pollution-control-project?lang=en
European Investment Bank (EIB)	EU	The EIB is the EU's bank, offering loans (individual for projects over 25 Mio. €, intermediate to other banks/institutions for SME with projects under 25 Mio. €). The EIB finances a broad range of projects in all sectors of the economy, adhering to one of the six priority objectives, of which "Climate and Environment" is of special importance for WFD implementation in the Danube.	No direct link to Danube SWMIs, but the EIB's financing can help to unlock financing from other sources, particularly from the EU budget. It has to be remarked, however, that the EIB provides loans, not grants.	EU and non-EU countries (all Danube countries).	*Applying for a loan: http://www.eib.org/projects/cycle/applying_loan/index.htm *For the Western Balkans, see Western Balkans Investment Framework: http://www.wbif.eu/
European Bank for Reconstruction	International	The EBRD is a development bank offering loans and	No direct link to Danube SWMIs, although a multitude of (mostly private	All countries in the Danube RB -	*Products and Services: http://www.eb
