
Danube Flood Risk Management Plan Update 2021: ANNEX 2 Overview of measures

Overview of measures for achieving the objectives for
the management of flood risks in the Danube River Basin
District

Version: v9 for public consultation

7.. List of transboundary projects supporting DFRMP	96

1 Introduction

Directive 2007/60/EC on the assessment and management of flood risks (European Floods Directive, FD) requires that Member States on the basis of the flood hazard and flood risk maps shall establish flood risk management plans coordinated at the level of the river basin district.

Member States shall establish appropriate objectives for the management of flood risks for the areas identified under FD Article 5(1) and the areas covered by FD Article 13(1)(b), focusing on the reduction of potential adverse consequences of flooding for human health, the environment, cultural heritage and economic activity, and, if considered appropriate, on non-structural initiatives and/or on the reduction of the likelihood of flooding.

The flood risk management plans have to include a summary of the measures and their prioritisation aiming to achieve the appropriate objectives of flood risk management, including the measures taken in accordance with FD Article 7, and flood related measures taken under other Community acts, including Council Directives 2011/92/EU on the assessment of the effects of certain public and private projects on the environment (1) and 2012/18 EU on the control of major accident hazards involving dangerous substances (2), Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment (3) and Directive 2000/60/EC.

According to FD Article. 14 the flood risk management plan(s) shall be reviewed, and if necessary updated, including the components set out in part B of the Annex, by 22 December 2021 and every six years thereafter. The part B of the Annex refers to components of the subsequent update of flood risk management plans:

1. any changes or updates since the publication of the previous version of the flood risk management plan, including a summary of the reviews carried out in compliance with Article 14;
2. an assessment of the progress made towards the achievement of the objectives referred to in Article 7(2);
3. a description of, and an explanation for, any measures foreseen in the earlier version of the flood risk management plan which were planned to be undertaken and have not been taken forward;
4. a description of any additional measures since the publication of the previous version of the flood risk management plan.

In accordance with the FD Article 7(2) the ICPDR agreed upon the following objectives for the Flood risk management plan for the Danube River Basin District:

- Avoidance of new risks
- Reduction of existing risks
- Strengthening resilience
- Raising awareness
- Promoting the solidarity principle

This overview of measures is structured in accordance with these basin-wide objectives.

This is a living non exhausting list of measures which could be amended if relevant.

2 Measures to avoid new risks

Aspects of flood risk management	Type	Description	Measures by countries
Prevention	Avoidance	Measure to prevent the location of new or additional receptors in flood prone areas, such as land use planning policies or regulation	<p>GERMANY</p> <ul style="list-style-type: none"> • Regional planning • Designation of floodplains • Urban land-use planning • Adapted landuse • Flood adapted planning and construction • Flood adapted handling of water-hazardous substances • Conceptions / studies / expertise • Information and training <p>AUSTRIA</p> <ul style="list-style-type: none"> • Compilation and update of hazard zone plans • Incorporation of hazard zone plans in spatial planning, building regulation and emergency management decisions • Development of concepts, plans, projects, strategies on catchment scale to improve the water and sediment balance • Compilation and incorporation of local and regional land use planning and land use development strategies

			<ul style="list-style-type: none"> • Definition of a framework for implementation and maintenance of flood protection and mitigation measures. <p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Elaboration or update of the zoning plans (to define area without buildings) • Application of results of flood hazard maps and flood risk maps as a limits in zoning plans • Change of functional use in zoning plans • Raising of buildings and other structures resilience (technical regulations) <p>SLOVAKIA</p> <ul style="list-style-type: none"> • Incorporation of delineated flood prone areas into spatial planning <p>HUNGARY</p> <ul style="list-style-type: none"> • New regulations on the flood risk areas on land use planning (less valuable land use) • New regulations on the flood risk areas in the field of construction (water resistant constructions) <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U1 - Flood hazard and flood risk mapping (legal restrictions for public or private investments through conditions and limitations for constructions and activities on flood risk areas & prevention of increasing the damage potential on flood hazard areas through municipal spatial plans and national spatial plans) • Measure U2 - Natural water retention measures • Measure U3 - River basin wide land use adaptation <p>CROATIA</p> <ul style="list-style-type: none"> • Continuation of activities on formal introduction of a special level of protection and
--	--	--	---

			<p>maintenance of natural water retention and wetland areas and boundaries of the public water domain in the process of physical planning</p> <ul style="list-style-type: none"> • Continuation of activities on registration of the public water domain in land registry • Monitoring of conditions on the public water domain <p>SERBIA</p> <ul style="list-style-type: none"> • Delineation of “water land”, its registration in land registries and entry into spatial plans • Entry of flood hazard areas into spatial plans of local self-government units and into urban plans, with definition of rules for the construction of the facilities and the use of flood hazard areas • Delineation of erosion-prone areas, entry into spatial plans and definition of conditions for their use <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Inclusion of flood areas into the spatial plans and other planning documentation • Preparation of missing maps of flood hazards for rivers <p>ROMANIA</p> <ul style="list-style-type: none"> • Introduction of flood hazard maps and flood risk maps in the Urban and Local Development Plans and update of the General Regulation and the Local Urbanism related to the General Urban Plans for territorial administrative units, by including medium and long term requirements, related to flood risk area, identified in the flood risk area and adoption of measures contained in the FRMP. • Territorial planning and urban planning based on flood risk assessments (flood studies) at different levels of detail, depending on their purpose (GUP – strategic flood risk assessments; ZUP/DUP – specific flood risk assessments). • Criteria and regulations for construction in the flood zone (e.g. updating the design
--	--	--	--

			<p>levels of constructions in the flood zone)</p> <p>BULGARIA</p> <ul style="list-style-type: none"> • Legislative restrictions of the construction works in the floodplains • Prohibition of the construction in flood-prone zones. • Restrictive measures to the investment intentions in areas adjacent to the river's bed. <p>MOLDOVA</p> <ul style="list-style-type: none"> • Preventing location of new or additional receptors in flood prone areas <p>UKRAINE</p> <ul style="list-style-type: none"> • Compliance of approved flood areas • Compliance of legislative documents related to the territorial development
Preparedness	Emergency Event Response Planning / Contingency planning	Measure to establish or enhance flood event institutional emergency response planning	<p>GERMANY</p> <ul style="list-style-type: none"> • Emergency event response planning • Conceptions / studies / expertise • Information and training <p>AUSTRIA</p> <ul style="list-style-type: none"> • Development of flood aware emergency management plans • Organisation of flood emergency operations and trainings especially with local fire brigades and potentially affected inhabitants <p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Flood inspection on rivers, water reservoirs and water structures

			<p>HUNGARY</p> <ul style="list-style-type: none"> • Renewal of the flood protection plans • Recalculation of design flood levels <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U14 - Contingency planning (flood event simulation exercises, creation and updating of regional and local emergency response plans for all APSFRs and other flood prone areas, providing additional flood response equipment) <p>CROATIA</p> <ul style="list-style-type: none"> • Updating of flood protection systems management plans and operative flood defence plans • Harmonization of operative flood defence plans with National civil protection directorate • Monitoring of data on flood events and effectiveness of flood protection measures <p>SERBIA</p> <ul style="list-style-type: none"> • Monitoring and inspection of the condition of flood protection structures • Monitoring and inspection of condition of erosion and torrents protection structures, the erosion processes and condition of torrential flows • Monitoring and inspection of condition of publicly owned drainage systems • Scenario development and action plan for localization of flooding (secondary defense line, controlled flooding, etc.) • Data and information exchange between institutions responsible for flood defense • Simulation exercises of response during floods
--	--	--	--

			<ul style="list-style-type: none"> • Capacity building of local self-government units for participation in flood defense <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Preparing report on setting limits concerning surface water in municipal cadastres • Application of restrictions related to flood areas and surface waters. • Application of agro-technical measures, forests managing measures and land-use in accordance with the nature protection. <p>ROMANIA</p> <ul style="list-style-type: none"> • Improvement of the monitoring systems, forecast models and warning systems (meteorological and hydrological); • Improvement of capabilities for detection and monitoring of hydrological dangerous phenomena (torrents, flash floods in small catchments, rapid increase of flows and in urban areas) <ul style="list-style-type: none"> - Supplementary monitoring points of levels and precipitation - automatic stations at bridges or pipeline trespassing - Video Surveillance for river flow monitoring and ice jam - New sensors generation for real time detection and alarm of thresholds exceedance by rainfall and torrential runoff intensity - Upgrade of national meteorological radar network - Pluvial monitoring network in urban areas and streets with risk on flooding survey (including flood mark installation) and water in sewerage systems - Dyke survey equipment (high resolution data collection cameras and drones connected to GIS, optical cables survey systems, inclinometers humidity survey etc.) and dam survey/monitoring equipment • Training and building administrative capacity of human resources (monitoring, forecast, dissemination); • Development/revision of flood defence plans correlated with other associated
--	--	--	---

			<p>emergency management plans (Civil Protection Plans);</p> <ul style="list-style-type: none"> • Updating the Civil Protection Plans: analysis of the population evacuation from the affected areas and the access roads to safe areas, signaling / identification of alternative access routes, resources completion of the rapid intervention centers of NARW and for Civil Protection and local authorities interventions • Annual simulation exercises with the participation of all county institutions with responsibilities in flood risk management, Improving the intervention action and cooperation of the authorities involved in the management of emergency situations <p>BULGARIA</p> <ul style="list-style-type: none"> • Elaboration or update of emergency action-plans for water systems and hydrotechnical facilities. • Develop of special flood-related action-plans for the “SEVESO” facilities <p>MOLDOVA</p> <ul style="list-style-type: none"> • Issuing of the DECISION NO. 1340 from 04.12. 2001 of the Commission for Emergency Situations of the Republic of Moldova on undertaking specific tasks related to population and territory protection from emergency situations <p>UKRAINE</p> <ul style="list-style-type: none"> • Development and approval of yearly plans on emergence response • Application of plans and solutions of commissions on of technogenic and ecological secure and emergency • Confinement plans development
	Other preparedness	Other measure to establish or enhance preparedness for flood events to reduce adverse consequences	<p>GERMANY</p> <ul style="list-style-type: none"> • Insurance, financial precautions

			<p>AUSTRIA</p> <ul style="list-style-type: none"> • Targeted information referring to individual responsibility and options for object-oriented measures <p>HUNGARY</p> <ul style="list-style-type: none"> • Communication of flood risk • New regulation of the financial circumstances <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U14 - Contingency planning (flood event simulation exercises, creation and updating of regional and local emergency response plans for all APSFRs and other flood prone areas, providing additional flood response equipment) <p>CROATIA</p> <ul style="list-style-type: none"> • Regulation of obligations of regular monitoring, analysis and reporting <ul style="list-style-type: none"> ○ Conditions of flood protection structures and systems ○ Data on flood events and effectiveness of flood protection measures ○ Conditions on the public water domain • Establishment of a registry of legal entities certified for performing preventive and operational flood defence <p>SERBIA</p> <ul style="list-style-type: none"> • Review of criteria for declaring flood defense phases • Bilateral cooperation • Regional cooperation (ICPDR, ISRBC, international projects, trainings, exercises, etc.) • Data and information exchange between institutions responsible for flood defence
--	--	--	--

			<ul style="list-style-type: none"> • Capacity building of experts and institutions responsible for flood defence <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Maintenance of existing flood protection facilities • Impact of climate change • Update of hydrological studies for characteristic high waters • Promotion of best practices in emergency flood defence • Development of a guide for the assessment of the embankment condition <p>ROMANIA</p> <ul style="list-style-type: none"> • Ensuring the preparation of human and material resources necessary for the management in good conditions of the emergency situations generated by the floods, including the groups of volunteers to participate in the rescue actions - evacuation of the population; endowment with materials and means of intervention at county/local level for Civil Protection, NARW, County and local authorities, as well as for all the owners of works with flood defence role. Ensuring material resources is available for dyke protection and enhancement, quality control of drinking water, advice on disinfection of wells and supply of water from alternative sources • Improving the degree of property insurance through mandatory policies and additional/complementary insurances, insurance of public assets, economics activities etc <p>BULGARIA</p> <ul style="list-style-type: none"> • Monitoring and forecasting of rainfall / runoff in the river basins. Monitoring of the dams • Broad access to the information and forecasts on water level, river-flow and ice conditions
--	--	--	--

			<p>MOLDOVA</p> <ul style="list-style-type: none"> • Communication on flood situation • Strengthening levees <p>UKRAINE</p> <ul style="list-style-type: none"> • Determination of potentially dangerous hydrotechnical structures • Modelling of the possible emergency situations
Protection			<p>GERMANY</p> <ul style="list-style-type: none"> • Assistance in urban pluvial flood risk management <p>AUSTRIA</p> <ul style="list-style-type: none"> • Improvement of retention capacity on catchment scale • Restoration of flood plains and sedimentation areas • Structural protection measures • Object oriented measures • Relocation and reallocation • Improvement of river inspection • Maintenance of protection and mitigation measures, river maintenance <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U7 - Structural flood protection measures • Measure U8 - Individual flood protection measures <p>ROMANIA</p> <ul style="list-style-type: none"> • Maintaining or increasing the proportion of forested area in the upper basins of

		<p>watercourses (not only APSFR);</p> <ul style="list-style-type: none"> • Maintaining or increasing the area of forests intended for: <ul style="list-style-type: none"> - hydrological protection; - intended for land and soil protection; • Floodplain and riparian woodlands management, including forest protection curtains for dikes • Reduction of runoff on the slope through anti-erosion forest curtains (agroforestry systems) • Reduction of local slope runoff through earthworks or the use of "surface runoff barriers" (earth waves / small wooden constructions, stone walls, hedgerows) • Improvement of lands affected by deep erosion or surface erosion by afforestation - requires supporting works for land stabilization terracing, erosion barriers, etc. • Promote and implement best practices in slope agriculture (e. g. cultivation practices for soil conservation) • Re-meandering, Restoration of channel and floodplain features (including reforestation of riverbanks for mitigation of erosion phenomena); • Leaky barriers (includes large woody structures, leaky weirs and soft engineered features) • NWRM - Offline storage areas (In-stream leaky weirs and/or lowered bank tops promote flood spilling, aiming to temporarily store floodwater on floodplain • Beach recharge • Creation of new permanent/non-permanent on-line (in – line) reservoirs • Creation of new off-line reservoirs • Heightening of dams to increase the storage capacity • Increasing the capacity of large spillways in order to increase the discharge capacity • Increasing riverbed transit capacity by resizing bridges • Updating / amending/ optimizing the operation rules of reservoirs in order to increase
--	--	---

		<p>the attenuation capacity; the coordinated operation of reservoirs in cascade</p> <ul style="list-style-type: none"> • Inter-basins connection channels (flood discharges/water volumes derivation) • Removal of retaining structures (dams' removal) - to be studied in each case. • Channelling of the river - local interventions (including stabilisation of the river bed) • Inventory of hydrotechnical works for the improvement of torrential riverbeds and evaluation of their status / functionality; • Rehabilitation of hydrotechnical systems used for the improvement of torrential riverbeds; • Consolidation of torrential riverbeds with small hydrotechnical works (up to 5 m elevation); • New dikes (along localities) or building second protection lines; • Protection dikes for coastal areas; • Heightening of the existing embankments; • Dikes rehabilitation for operating to their design standards; • Assessment of setting back, partial or full removal of flood embankments (to be studied in each case); • Enhancing/Rehabilitation of sewage systems, drainage systems, pumping stations (including improvement of the drainage of linear infrastructures: roads, railways, if necessary); • Development and/or adaptation of existing regulations regarding Sustainable Drainage Systems; • Development of guidance publications of good technical practices in the implementation and maintenance of drainage systems • Enhancing artificial drainage capacities through sustainable drainage systems. •
Other		<p>GERMANY</p> <ul style="list-style-type: none"> • Financial aid program

		<p>AUSTRIA</p> <ul style="list-style-type: none"> • Information and training initiatives <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U1 - Flood hazard and flood risk mapping • Measure U2 - Natural water retention measures • Measure U3 - River basin wide land use adaptation • Measure U4 - Hydrological and meteorological monitoring • Measure U5 - Flood risk related databases • Measure U6 - Raising awareness about flood risk • Measure U9 - U9 Continuous efficiency control of the flood protection measures • Measure U10 - Water infrastructure maintenance works • Measure U12 - Proper management of flood, water, hydropower and other infrastructure • Measure U15 - Flood forecasting <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Application of anti-erosion measures in the river basins and measures for torrents defence • Maintenance of objects against erosion and torrents • Development of flood risk insurance <p>CROATIA</p> <ul style="list-style-type: none"> • Analysis of the climate change effects on the concepts of flood protection and flood risk management
--	--	---

		<p>ROMANIA</p> <ul style="list-style-type: none"> • Preparation of studies to improve knowledge on flood risk management: <ul style="list-style-type: none"> - start a national programme to delineate flood zones by hydraulic modelling for the whole territory of Romania (and not just for APSFR) - improved statistical analysis, effect of climate change - development of new hydrological data sets to support the hydrological and hydraulic modelling - flood vulnerability assessment, flood risk mapping; - studies and analysis of environmental, economic and social viability of structural actions; completion of a WFD, Habitats Directive, Birds Directive Compliance Assessment and coordination with EU strategies (EU Biodiversity Strategy for 2030, EU Strategy on Green Infrastructure) • Enhancing flood management policies / strategies/legislative framework • Maintenance of riverbeds • Carrying out maintenance works for the safe operation of existing hydraulic structures and related equipment (e.g. maintenance and repairs etc.) • Restoring/Maintaining the attenuation volumes of existing reservoirs / storages (permanent/non-permanent) • Increasing the safety of existing dams, intakes (e.g. retrofitting measures to limit infiltrations, etc.) • Ensuring the preparation of human and material resources necessary for the management in good conditions of the emergency situations generated by the floods, including the groups of volunteers to participate in the rescue actions - evacuation of the population; endowment with materials and means of intervention at county/local level for Civil Protection, NARW, County and local authorities, as well as for all the owners of works with flood defence role. Ensuring material resources is available for dyke protection and enhancement, quality control of drinking water, advice on disinfection of wells and supply of water from alternative sources
--	--	--

		<ul style="list-style-type: none"> Improving the degree of property insurance through mandatory policies and additional/complementary insurances, insurance of public assets, economics activities etc <p>BULGARIA</p> <ul style="list-style-type: none"> Flood-resilient design and construction of buildings
--	--	--

3 Measures reducing the existing risks

Aspects of flood risk management	Type	Description	Measures by countries
Prevention	Removal or relocation	Measure to remove receptors from flood prone areas, or to relocate receptors to areas of lower probability of flooding and / or of lower hazard	<p>GERMANY</p> <ul style="list-style-type: none"> Removal/relocation Information and training <p>AUSTRIA</p> <ul style="list-style-type: none"> Incorporation of hazard zone plans Relocation and reallocation Information and training

			<p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Removal or relocation of buildings • Spend the rest of buildings and functional use life <p>HUNGARY</p> <ul style="list-style-type: none"> • Removal or relocation of dykes <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U2 - Natural water retention measures • Measure U3 - River basin wide land use adaptation <p>SERBIA</p> <ul style="list-style-type: none"> • Removal of potential sources of pollution in case of floods from flood hazard areas • Removal of structures illegally built in flood hazard areas <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Relocation of most endangered population based on risk map data • Relocation of any potentially dangerous industrial facilities away from the flood risk areas <p>ROMANIA</p> <ul style="list-style-type: none"> • Analysis of technical and economic possibilities for the relocation of buildings from flood zones with water depths greater than 1-1.5 m to other areas with lower water depths (corresponding to the event with a probability of 1%), with the identification of legal solutions and funding sources.
--	--	--	---

			<p>BULGARIA</p> <ul style="list-style-type: none"> • Removal of illegally built constructions, barriers, and other artificial obstacles located in the river's beds or in the gullies • Closure and reclamation of unused and abandoned industrial and contaminated sites <p>MOLDOVA</p> <ul style="list-style-type: none"> • Removal or relocation of buildings <p>UKRAINE</p> <ul style="list-style-type: none"> • Settling out of population from the flood hazard area • Change of land use
	Reduction	Measure to adapt receptors to reduce the adverse consequences in the event of a flood actions on buildings, public networks, etc...	<p>GERMANY</p> <ul style="list-style-type: none"> • Flood adapted renovation • Physical protection of buildings • Flood adapted handling of water-hazardous substances • Conceptions / studies / expertise • Information and training • Research and development projects and best practice projects <p>AUSTRIA</p> <ul style="list-style-type: none"> • Object oriented measures • Definition of a framework for implementation and maintenance of flood protection and mitigation measures.

			<p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Individual flood protection measures <p>SLOVAKIA</p> <ul style="list-style-type: none"> • optimisation of floodplains zoning with respect to existing infrastructure <p>HUNGARY</p> <ul style="list-style-type: none"> • training local defence leaders, municipality responsible groups • update or create local defence plans • update regional localization plans <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U8 - Individual flood protection measures <p>SERBIA</p> <ul style="list-style-type: none"> • Reassessment of the flood protection level and optimisation of the size of flood protected areas • Local flood protection measures (on single or group of buildings), wherever possible • Reassessment and modification of vulnerable infrastructure (especially road and railroad crossings on rivers) • Training and encouraging population to implement flood self-protection measures <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Promotion of good practice for the construction of residential and
--	--	--	--

			<p>infrastructure facilities in floodplains</p> <ul style="list-style-type: none"> • Promotion of self-protection measures for the population against floods <p>ROMANIA</p> <ul style="list-style-type: none"> • Adaptation measures of existing buildings located in flood zones, with the identification of legal solutions and funding sources; • Examples of measures to adapt existing buildings in flooded areas <p>Internal property measures</p> <ul style="list-style-type: none"> - Avoidance technology - Building elevation; - Controlled/accepted flooding (wet floodproofing)-construction materials must be water resistant and all utilities must be above the flood design (the measure does not apply to floods characterized by high depths and water velocities) - Dry floodproofing-blocking the entry of water into the basement and sealing the building (with waterproof foils or other materials to prevent water from entering the house) and is applicable in areas characterized by flood shallow depth and low water speed. <p>External property measures</p> <ul style="list-style-type: none"> - Protection barriers (Berms/Local Levees and Floodwalls) - ring structures that can be placed around a single building or a small group of buildings (must also include drainage and drainage systems to evacuate water from the protected enclosure) - Temporary protective barriers - construction of movable parapets. • Permanent protective barriers - construction of fixed parapets, local dikes / flood protection walls. Publication of guidelines / elaboration of regulations
--	--	--	--

			<p>regarding measures for adaptation of existing buildings in floodable areas / Increasing population resilience Guidelines</p> <p>BULGARIA</p> <ul style="list-style-type: none"> • Assessment of the discharge and drainage of rainwater – especially via the sewage network • Construction /re-construction of drainage facilities • Construction of new sewerage networks with sufficient capacity <p>UKRAINE:</p> <ul style="list-style-type: none"> • Construction of flood protection structures in compliance with approved programs
	<p>Other prevention</p>	<p>Other measure to enhance flood risk prevention (may include, flood risk modelling and assessment, flood vulnerability assessment, maintenance programmes or policies etc...)</p>	<p>AUSTRIA</p> <ul style="list-style-type: none"> • Compilation and update of hazard zone plans • Compilation and incorporation of local and regional land use planning strategies <p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Individual evaluation of flood risk and comparison with vulnerability • Programme to finance, to maintain and to check flood protection measures • Technical and safety supervision of water structures • Using of good agricultural practice principle (selection of plants, rotation of plants etc.) <p>SLOVAKIA</p> <ul style="list-style-type: none"> • Effectiveness validation of flood mitigation and protection measures by hydraulic modelling

			<p>HUNGARY</p> <ul style="list-style-type: none"> • Flood modelling • Land use changes on the catchment area • Education <p>SLOVENIA</p> <ul style="list-style-type: none"> • Measure U1 - Flood hazard and flood risk mapping <p>CROATIA</p> <ul style="list-style-type: none"> • Assessment of status and updating (if needed) of concepts of the existing: <ul style="list-style-type: none"> ○ For the purpose of harmonization with the flood risk management objectives ○ For the purpose of compensation for an increase in the flood risks due to the use of natural water retention, wetland and floodplain areas for settlements and agricultural areas in the process of uncontrolled construction and urbanization of such areas ○ Assessment of functionality of the existing regulation and protection facilities <p>SERBIA</p> <ul style="list-style-type: none"> • Review and if necessary, update of the Preliminary Flood Risk Assessment • Preparation of a disaster risk assessment in accordance to the Law on Disaster Risk Reduction and Emergency Management • Update/preparation of documentation for flood defense • Update/preparation of documentation for the use and management of the operational regime of reservoirs
--	--	--	--

			<ul style="list-style-type: none"> • Preparation of standards and norms for the maintenance of flood protection structures, erosion and torrents protection structures and drainage systems and for the implementation of flood defense • Update/preparation of the register of hydraulic structures • Update/preparation of the register of torrents • Maintenance and upgrade of the Water Information System with the establishment of connection with other information systems • Increase of the efficiency of the inspection service • Preparation of flood hazard and flood risk maps • Preparation of the erosion map • Entry of the erosion-prone areas into the planning documents of the agriculture and forestry sectors <p>BOSNIA AND HERZEGOVINA</p> <ul style="list-style-type: none"> • Reconstruction measures for flood defence objects • Regular ongoing maintenance of existing flood defence objects • River training projects in the areas indicated by flood risk maps • Flood modelling <p>ROMANIA</p> <ul style="list-style-type: none"> • Preparation of studies to improve knowledge on flood risk management: <ul style="list-style-type: none"> - start a national programme to delineate flood zones by hydraulic modelling for the whole territory of Romania (and not just for APSFR) - improved statistical analysis, effect of climate change - development of new hydrological data sets to support the hydrological and hydraulic modelling
--	--	--	--

			<ul style="list-style-type: none"> - flood vulnerability assessment, flood risk mapping; - studies and analysis of environmental, economic and social viability of structural actions; completion of a WFD, Habitats Directive, Birds Directive Compliance Assessment and coordination with EU strategies (EU Biodiversity Strategy for 2030, EU Strategy on Green Infrastructure) • Enhancing flood management policies/strategies/legislative framework • Maintenance of riverbeds <p>BULGARIA</p> <ul style="list-style-type: none"> • Flood risk modelling and mapping <p>MOLDOVA</p> <ul style="list-style-type: none"> • Preparation of flood risk and flood hazard maps <p>UKRAINE:</p> <ul style="list-style-type: none"> • Elaboration of flooded areas • Elaboration of confinement plans • Development of automated monitoring and modelling systems
Protection	Natural flood management / runoff and catchment management	Measures to reduce the flow into natural or artificial drainage systems, such as overland flow interceptors and / or storage, enhancement of infiltration, etc and including in-channel , floodplain works and the reforestation of banks, that restore natural systems to help slow flow and store water.	<p>GERMANY</p> <ul style="list-style-type: none"> • Natural water retention in the catchment • Natural water retention in wetlands • Reduction of sealing • Natural water retention in settlement area • Recovery of floodplains • Conceptions / studies / expertise • Research and development projects and best practice projects

			<ul style="list-style-type: none"> • Information and training <p>AUSTRIA</p> <ul style="list-style-type: none"> • Restoration of flood plains and sedimentation areas • Definition of operating instructions for flood prone and flood influencing facilities <p>CZECH REPUBLIC</p> <ul style="list-style-type: none"> • Erosion protection measures in the river basins (complex land processing) • Support of rainfall infiltration • Interruption of trajectories of concentrated runoff (including forest roads) • Restoration of small retention areas • Restoration or revitalization of old amelioration structures • Protection and restoration of floodplains • Good management of alluvial plains to reduce runoff • Revitalization of rivers <p>SLOVAKIA</p> <p>Measures to reduce (decelerate) run-off from river basin into the water courses, to increase retention capability of river basin or to support natural accumulation of water in the suitable areas – measures at agricultural soils, in forests and urban areas</p> <ul style="list-style-type: none"> • operational erosion control measures (organisation of land with respect to erosion control, agro-technical erosion control measures, biological erosion control measures) • technical erosion control measures (erosion control trenches, terraces at hillslopes)

7 List of transboundary projects supporting DFRMP

The projects or project proposals/ideas presented here were developed by the ICPDR and/or EUSDR PA5¹ and they shall i.a.:

- Reflect the objectives and priorities set in this Danube Flood Risk Management Plan;
- Have a transboundary character;
- Help to implement the needs listed i.a. in this Annex.

There is no ranking or prioritization of these projects, they are all considered as supportive to the implementation of the Danube Flood Risk Management Plan.

7.1 Danube Sediment Project

One of the main goals of the proposed project was to establish for the first time a Danube river basin sediment budget, identify reaches with surplus and deficit, river bed aggradation and degradation, sediment-related problems in flood risk management, drinking water production, hydropower generation, navigation, water quality and ecology, as well as gain knowledge and better understanding of sediment transport and morphodynamic processes in the Danube River.

The specific aims of the Danube Sediment Project were the following:

- Collect existing sediment data and analyse their quality
- Perform limited sediment transport monitoring at short but important reaches with significant data gaps
- Perform limited sediment transport monitoring and modelling in Pilot Reaches
- Identify the sediment quantity related issues at different space and time scale
- Identify reaches with sediment deficits and surplus and quantify the trends
- Quantify the role of major tributaries in the sediment transport of Danube River
- Develop a sediment balance for the whole Danube River and the input of major tributaries
- Discuss with stakeholders the sediment management problems and options associated with sediment transport
- Summarize and evaluate existing sediment management options

¹ Letters of recommendation are critically important pieces of every project. Letter of Recommendation and Letter of Merit from EUSDR PA5, please visit the: <https://environmentalrisks.danube-region.eu/projects/pa5-letter-of-recommendation-lor/>

- Risk analysis related to sediment quantity
- Improve the knowledge on sediment transport mechanisms in Danube River
- Prepare a Danube Sediment Management Concept
- Policy recommendations

Detailed description of the project outcomes is provided in the DFRMP chapter 5.5.6.1

7.2 Danube Floodplain project

Overall objective of the proposed project is to reduce the flood risk through floodplain restoration along the Danube and other DRB rivers

The specific objectives include the following:

- to develop a common approach on restoring the water storage capacity of floodplains, from upstream to downstream sections;
- to develop best practice on using 'green infrastructure' for sustainable flood risk management in the Danube River Basin;
- to contribute to the more effective implementation of the EU WFD and Floods Directive with their Programmes of Measures;
- integrating the requirements and opportunities related to other EU policies, notably the Nature Directives, Biodiversity and Climate policy, and of the 2020 Strategy;
- to foster cooperation among Danube Basin countries in using restored floodplains for flood management;
- to demonstrate the feasibility of integrated flood management, including a combination of classical and "green infrastructure" in selected floodplain areas;
- to stimulate stakeholder involvement and cooperation in floodplain restoration / flood management planning and implementation.

Detailed description of the project outcomes is provided in the DFRMP chapters 5.5.6.2 and 6.3.3

7.3 "DANICE" project

The intention of the DANube river basin ICE conveyance investigation and icy flood management project was to focus on:

- Report of recorded ice floods /events in the Danube basin
- Creating a database of registered ice observations and GIS-based map summary in the Danube basin

- Hydrologic and hydraulic investigation on the ice observation, conveyance and forecasting
- Discretization of stretches (Danube and tributaries), structures and certain sections that are frequently exposed to “freezing hazard”
- Listing monitoring stations, well placed observation points, webcams etc. that are suitable for tracing ice conveyance and ice coverage development along the river and its tributaries
- Definition of efficient observation methodology of floating ice plate conveyance on the Danube (e.g. satellite images), suggestions of monitoring development
- Setup of an online international tracking site for ice transport,
- Identification of 1D and 2D modelling capabilities of ice conveyance calculations, listing and evaluation of tools’ capabilities
- Evaluation of different measures to open ice barriers or avoid their development,
- Measures and pilot areas
- Summarizing the ice breaker fleet in the Danube basin (synergies could be noticed with Newada and Newada Duo project, FAIRway), evaluation of international agreements
- Definition of good practices to avoid ice jams

DTP SMF did not provide funding for project preparation. Intention was to submit the project proposal for the 3rd DTP Call but finally there was no activity made in this respect. The FP EG together with the EUSDR PA5 will further explore the possibilities of project funding in the next management cycle.

7.4 "LAREDAR" project

Hazard and risk mapping, risk management planning of the LAkes and REservoirs in the DANube River basin shall focus on:

- Inventory of potential flood-problematic lakes and reservoirs (L&R), realization of problems, GIS database and bed geometry data with supplying rivers (sub-catchments)
- Hydrologic assessment of the events that cause inundation around the lake or failure of defence system
- Hazard and risk mapping of the L&R, risk management strategies for L&R
- International consequences and conditions in the operation, good practice or agreements for the future

DTP SMF did not provide funding for project preparation. The project proposal was submitted to the 3rd DTP Call, but the submission failed because of an internet failure during the project proposal

upload. The FP EG together with the EUSDR PA5 will further explore the possibilities of project funding in the next management cycle.

7.5 Coca-Cola - WWF “Partnership for a living Danube”

The

WWF, the Coca-Cola Foundation and Coca-Cola System have been working together in a seven years partnership to restore vital wetlands, river sections and floodplains along the Danube River and its selected tributaries by the year 2020, and to promote the wise use of freshwater resources in the Danube Basin.

The partnership was officially launched in the frame of the 12th Standing Working Group Meeting in Sofia in June 2014. The ICPDR is an observer in the Steering Group of the Partnership. The Partnership is working closely with local stakeholders and relevant authorities to connect river stretches, side-branches or other floodplain areas to the river system by mainly opening rock fill dams, installing or modernising sluices for water retention, improving water supply channels or building fish-pass. At the same time, a regional movement is being created for wetland conservation and restoration, as well as good water stewardship.

There are two larger focus areas: the Lower Danube Green Corridor (RO and BG) and the Mura-Drava-Danube Trans-Boundary Biosphere Reserve (Croatia, Hungary and Serbia) as well as soda lakes in Austria.

The regional programme includes nine restoration projects in six countries: Hungary, Croatia, Serbia, Romania, Bulgaria and Austria. Five projects have been completed by May 2020, and another four are in various stages of development. 120 km river connectivity in Bulgaria and over ca. 4300 hectares of wetlands have been restored or water supply improved to date, including Siroki Rit in Serbia, the Barcs-Old-Drava oxbow in Hungary, Neusiedler See in Austria and Persina and Kalimok wetlands in Bulgaria. Four river and wetland restoration projects are either in their planning or implementation phase in Croatia (6 Drava River side-arms), Hungary (Lankoc floodplain forest along the Drava River), Romania (Garla Mare and Vrata on the Lower Danube). Despite the fact that one project will need a deadline extension from EU LIFE, progress is mainly on track to achieve the 5,237 ha and 12 million m³ water retention objectives by the end of 2020, however in case of at least one project, due to COVID-19 pandemic situation most probably there will be a delay with implementation of the field works. In a number of cases, financial support from the Coca-Cola Foundation is being used to leverage and secure co-finance support from other sources, mainly EU LIFE funds.

Progress has also been made towards the communication and mobilisation objectives for the Partnership. The “Living Danube Tour”, an interactive mobile exhibit on the value of wetlands, had 71 stops in the region from the start of the regional programme. It has directly involved at least 90,000 people (target of 60,000 by 2020) and reached over 9,5 million people via traditional and social media. Since June 2019, the Freshwater related communication on regional level generated additional ca. 400 000 indirect reach through media, social media, articles and websites. The partnership has also produced a series of Living Danube videos about the Partnership’s restoration

activities in the last six years. More information can be found under the following weblink panda.org/living_danube and in the ANNEX 5.

7.6 Improvement of flood forecasting

Implementation step I: Inventory on the available data, information and exchange mechanism, designation of data needs by the national flood forecasting institutions and transnational instruments. Possible solutions are to create and operate national, bilateral, multilateral data exchange platforms for the national forecasting services of the Danube Region to provide them with the necessary data/information to improve their flood forecasting capabilities, taking into account the existing mechanisms and systems.

Implementation step II: Launch a research programme to improve the flood forecasting models by:

- Comparing the efficiency, accuracy, lead time etc. of the existing national, regional and Danube basin wide models
- Exchanging information on the national and trans-national Danube Basin forecasting models for better understanding of their outputs
- Further developing the national models or developing international models (like the Dráva-Mura forecasting model or the European Flood Awareness System)
- sharing models and/or methods

The above-mentioned activities have been addressed in the frame of the DAREFFORT project. Detailed description of the project outcomes is provided in the DFRMP chapter 5.5.6.3

7.7 Information exchange on the operation of hydraulic structures

Flood forecasting and flood management need real time information and data on the operation of flow control structures. Pre-emptying the reservoirs of holding back water to fill up the reservoirs influence the precision of the flood forecasting and can endanger the flood management of the downstream stretches.

Implementation steps: The goal is to agree with the Danube countries and the operators of flow control structure to make their operational rules and real time data available for the national flood forecasting institutes and for the flood management organisations.

Elements of the cooperation have to:

- Identify relevant structures
- Make the real-time operational parameters available to forecasters,

- Make the operational rules (operational manuals) of the flow control structures available for flood forecasters and flood managers,
- Establish procedures and ICT infrastructure to warn flood forecasters when the pre-emptying or filling up of the reservoirs start (e.g. changes in discharge),
- Develop cooperation among the operators and flood managers to ensure that flood protection has got priority in the operation of flow control structures in peak periods (e.g. flood managers shall have the possibility to ask the operators to change the operational state if flood situation requires it),
- Prepare a unilateral framework agreement based on previous steps for the Danube Basin.

These activities were planned to be covered in the frame of the LAREDAR project. The project proposal was submitted to the 3rd DTP Call, but the submission failed because of an internet failure during the project proposal upload. The FP EG together with the EUSDR PA5 will further explore the possibilities of project funding in the next management cycle.

7.8 Coordination of operative flood management plans

Coordination in operative flood management is increasingly important with more floods affecting multiple countries and exceeding peak historical levels in the last years.

One of the outcomes of the Flood Survey conducted by the coordination of EUSDR PA5 after the extreme floods on the Danube River in 2013/14 was the need to harmonize/coordinate Operative Flood Management Plans (OFMPs) along the Danube. That is why one of the measures of the Danube Region Operative Flood Management and Cooperation Programme (DR Oper & Cooper) – included also in the DFRMP adopted by the ICPDR and all the 14 Danube countries – is to coordinate the operative flood management and civil protection plans in the Danube Basin. This includes the evacuation plans and procedures, safeguarding people, goods, emergency rescue plans, etc. considering the benefits of the civil protection mechanisms for the shared flood basins or stretches of common interest to better use the available resources.

An international workshop was organized by the EUSDR PA5 Hungarian co-coordination on the 27 November 2019 in Pécs, and a summary Study² was published in 2020. The aim of the workshop was to exchange information about the best intervention practices and to review flood protection equipment, materials, resources and sets available in case of an emergency situation.

Coordination of operative flood management plans was incorporated into the REVITAL I, DANICE, and MUNICIPAL-AID projects. More detailed information about the progress is available in the respective paragraphs below and in the DFRMP chapter 5.5.6.4.

² <https://environmentalrisks.danube-region.eu/wp-content/uploads/sites/7/sites/7/2020/04/Study-on-operative-flood-management-plus.pdf>

7.9 Development of elements of flood risk management plans for trans-boundary sub-units of common interest

Implementation steps: Provide sub-units that need further support to meet the EUFD deadline on FRMP with resources and pilot projects developed under this Measure. Support the monitoring of the implementation and the review of the plan with planning the next FRMP for the sub-basin

These activities are covered by the MUNICIPAL-AID project. More detailed information about the progress is available in the respective paragraph below.

7.10 Exchange of flood protection techniques, technologies and experiences

For the last decade a proliferation of new flood protection techniques and technologies could be seen. Some countries use mobile dams, some use mobile walls, some others prefer inflatable dams etc. The floods of the recent decade provided the opportunity to learn about advantages and/or disadvantages of these structures.

Proposal: collect and exchange information of the new equipment both from design and operational point of view. This can be done through a networking project by organising workshops and or seminars.

These activities are covered by the MUNICIPAL-AID project. More detailed information about the progress is available in the respective paragraph below.

7.11 Develop an education/training network

Proposal: Develop an education/training network of universities/training centres to “train trainers” and develop curricula for training of flood managers.

Agreement on flood protection education

In 2016 with the coordination of the Danube Region Strategy (EUSDR PA5) the National University of Public Service Hungary signed a Collaboration Framework Agreement with German, Slovakian and Serbian universities in order to develop an international curriculum on flood protection engineering as the core of the proposed education network.

International Workshop for Flood Protection Education Network in the Danube River Basin

Ministry of Foreign Affairs and Trade of Hungary, Priority Area 5 (PA5 – Environmental Risks) of the European Union Strategy for the Danube Region (EUSDR) and the National University of Public Service of Hungary organize a workshop on flood protection education. The workshop was held on the International Danube Day, on 29th June 2017 in Budapest as an event of the Hungarian Presidency of the Danube Region Strategy.

InterFloodCourse

The development an education network followed up by the InterFloodCourse project. More detailed information about the progress is available in the respective paragraph below.

International Water Governance and Water Diplomacy

The University of Public Service of Hungary launches a Master of Arts programme in International Water Governance and Water Diplomacy for the academic years of 2020. The two-year MA programme in International Water Governance and Water Diplomacy, started September 2020, offers up-to-date, practice-oriented education for practicing and future water managers, diplomats, national and international civil servants engaged in transboundary or global environmental issues. Based on a blend of natural and social sciences, extensive field training and project-based teamwork, the programme is aimed to enable students to master complex water policy challenges, decision and conflict situations. The EUSDR PA5 Hungarian co-coordination and the Ministry of Foreign Affairs and Trade supported the new educational program.

7.12 Enhance coordination of operative flood protection methods and equipment

For risks that are common to a large number of countries in the region (i.e. floods) it is important to strengthen cross-border cooperation. To ensure that civil protection authorities have a good understanding of each other's systems. For instance, available assets and potential gaps, working procedures, and that teams can also function smoothly in case of major emergencies involving bilateral, European, or international response. This measure will be developed also in close collaboration with the envisaged voluntary pool of European assets for disaster risk management as foreseen by the EU's Civil Protection mechanism. The further and thematic involvement of the disaster risk management in the Danube region will be managed according to the EUSDR PA5 Disaster Management Working Group.

Task 1: Coordination of the regional disaster risk assessment / damage data recording methods and measures, taking into account the specific effects of the climate change phenomena in the region, for better disaster prevention.

Task 2: Build advanced training and appropriate capacity of the flood rescue teams and civil protection operative units

As part of the implementation of DFRMP, PA5 supported the development of flood protection training network by development of creating an e-learning material focusing on floods and organizing a large-scale flood protection training and response exercise (DAREX) and an international operative flood management workshop. The EUSDR PA5 Disaster Management Working Group was established in 2019 in order to concentrate on emergency response and preparedness elements of managing environmental risks.

Task 3: Establishment of the cooperation forum of the Danube basin municipalities and/or relevant institutions for better preparedness, awareness and data sharing during flood related interventions and other regional disasters.

These activities are covered by the MUNICIPAL-AID project. More detailed information about the progress is available in the respective paragraph below and in the DFRMP chapter 5.5.6.6.

7.13 Analysis of catchment reaction on different precipitation scenarios in the upper Danube including identification of retention sites

The 2013 flood event in the Danube catchment evidenced the importance of flood storage polder. Therefore, the Bavarian flood protection strategy focusses on natural and technical retention in the river catchments. The main objectives of this study of the upper Danube / Inn River catchment are:

- Identification of new retention sites in the whole Inn River catchment
- Analysis of the retention potential of the current barrages along the Inn River -> barrage management
- Statistical analysis of different precipitation scenarios with the Copula-method.

This project between Germany and Austria is still ongoing.

Progress:

The investigation area comprises the river Inn starting at Kufstein/ Oberaudorf up to the confluence of the river Inn and the Danube in Passau including the river Salzach. In general, conditions are examined at both sides of the riverbank. Project partners are the Technical University Wien, the chair of hydrology and river basin management at the Technical University Munich, the University Kassel as well as the chair of hydraulic and water resources engineering at the Technical University Munich. The project is subdivided into six work packages:

The spatial-temporal behaviour of flood waves and their likelihood of occurrence is part of WP A and is simulated with a stochastic precipitation-runoff modelling approach. In WP B the range of flood events is generated using the Copula method to define inlet boundary conditions and constraints of the numerical model. The objective of WP C is to find out the retention potential of each weir plant based on its organisation of weir operation. In WP D potential retention sites with the best cost-value-ratio should be identified for polders controlled or uncontrolled as well as for relocation of dikes. The potential retention sites are chosen with regard to their impact on flow balancing and their temporal influence on flood waves of different probabilities of occurrence. The effect analyses are conducted with in total twelve flood events. In addition, the sites are evaluated based on their impact with regard to the structural engineering, residential areas – infrastructure – human beings, agriculture – forestry and ecology. The characteristics of each site are summarised in a site portrait. WP E is dealing with sediment transport processes regarding agricultural aspects, operation of hydroelectric power stations and flood hazards due to reduced discharge capacities. In WP F the alteration of the riverbed due to flood and its hazard potential should be analysed using a physical model combined with numerical calculations of the hydro-morphological processes.

The work packages A and B are completed, WP C is nearly completed. The other work packages are still ongoing.

7.14 ProDaM – Protect Danube and Morava

The project objective is to optimize the joint flood management in the border area of the Danube and Morava between Austria and the Slovak Republic. The specific objectives include the following:

- Analysis of the residual risk at the river Morava
- Common understanding about residual risk and residual risk management

- Planning of the improvement of the common flood protection dam Wolfsthal-Petržalka

The overall objective and/or benefit of the project is to protect the border regions by means of coordinated flood measures.

The ProDaM project is ongoing. The data acquisition by means of laser scan flights is of priority.

7.15 DAMWARM project (Drava And Mura WAter and Risk Management)

Project focuses on better and more efficient Drava and Mura river basin and flood (and other) risk management. The Drava River is the fourth largest tributary of the Danube and its main course is full of hydropower plants and other large water management infrastructure. Floods, drought and other risk management without the full, swift and online cooperation and communication of water management authorities and hydropower plants' operators is nearly impossible. Large floods, droughts and different environmental issues in the past few years (especially the floods in year 2012) have shown that a better communication between water management and hydropower plant operators is needed.

Main activities of the project are:

- analysis and review of all the existing flow models & forecasting systems in both transboundary river basins;
- development of flow forecasting models for parts of both Drava and Mura river basins where they don't exist;
- thorough review and analysis of all the existing rules of operations for all existing hydropower plants and other water management infrastructure in both transboundary river basins;
- development of new set of hydropower plant and other water management infrastructure's operational rules incorporating newest flow and meteorological forecasting knowledge and models, environmental objectives and other sustainability principles;
- operational set-up of the common flood forecasting system and platform for both transboundary rivers basins covering four countries;

The main results of the project include:

- development of the flow forecasting models for the Drava and Mura river basins where they don't exist;
- development of the ecologically sound, sustainable and effective (from the public interest point of view at the times of floods and droughts) rules of operation for the hydropower and other water management infrastructure in both river basins;
- development of joint flow forecasting platform integrating all the existing national and newly developed forecasting models and its operational set up.

Partners in the project include responsible water management authorities from Austria, Slovenia, Croatia and Hungary and all hydropower plant operation public companies.

Project was submitted to different funding calls, but was not successful. Project is therefore put on hold, while additional funding possibilities are being explored.

7.16 FRISCO 1

The FRISCO1 project (Cross - Border Harmonised Slovenian - Croatian Flood Risk Reduction 1 - Non Structural Measures, <https://frisco-project.eu/hr/>) is a strategic project aimed at reducing flood risk in the river basins of the Dragonja, Kupa / Kolpa, Sutla / Sotla, Bregana and parts of the Drava and Mura river basins and is implemented in the framework of the Cooperation Programme INTERREG V-A Slovenia - Croatia.

The main purpose of the measures envisaged in FRISCO1 is to protect lives and property and reduce damage by flooding. In addition to improving flood safety in these cross - border river basins, the conditions for developing sustainable tourism and preserving the rich biological diversity of the border area will be improved; moreover, the project also contributes to the objectives of the EU Danube Region.

Results of the project are:

- Improved databases for flood risk management,
- Cross-border studies of comprehensive flood risk management,
- Improved hydrological hydraulic models,
- Improved flood prediction model,
- Improved and cross - border harmonised flood risk maps,
- Common projects (preparing project and other documentation),
- Early warning system (upgrading predictive and warning alarm system),
- Raising awareness of the public on flood risks and institutional strengthening of the flood risk management system.

FRISCO1 is the first approved strategic project in the framework of the cross-border Cooperation Programme Slovenia - Croatia for the programming period 2014 - 2020 (INTERREG V-A Slovenia - Croatia). For the project, valued at EUR 4,070,950 million, 85 % is contributed by the European Regional Development Fund and 15 % by all project partners combined. Project FRISCO1 has successfully finished in summer 2019 and all the results are available at its website.

Based on the results of FRISCO1 Project, three additional projects aiming at structural flood risk mitigation measures were launched:

- FRISCO 2.1 (Cross-Border Harmonized Flood Risk Reduction 2.1 - Structural Measure Vonarje dam, <https://frisco21-project.eu/en/>),
- FRISCO 2.2 (Cross-Border Harmonized Flood Risk Reduction 2.2 - Construction measures in the Mura River Basin, <http://frisco22-project.eu/home-en/>) and
- FRISCO 2.3 (Cross-Border Harmonized Flood Risk Reduction 2.3 - Structural Measures in the Drava and Kolpa / Kupa river basins).

7.17 DAREnet

DAREnet is a network of practitioners dealing with flood resilience in the Danube River Region, supported by a continuously evolving multi-disciplinary community of stakeholders consisting of policy makers, academics, industry and many more. ICPDR is an active project partner.

Further information is presented in the DFRMP chapter 5.5.3.3.

7.18 Danube H2020 Insurance Project

Probabilistic modelling increases confidence of risk assessments of low-probability, high-impact flood events and represents the standard approach in, for example, the insurance industry. Combining the approaches from climate impact research and the insurance industry, a probabilistic, high-resolution flood model for the entire Danube River basin (the Future Danube Model) was constructed as part of the EU-funded H2020_Insurance project (2017–2020) and in cooperation with insurance partners.

Further information is presented in the DFRMP chapter 5.5.6.7.

7.19 MUNICIPAL-AID

Multi-national Initiative for Civil Protection Actions in Danube Region.

The project identifies interlinkages of policies, gaps and examples of implementation, and deploy pilot activities to build the recommendations into practice. Comprehensive approach for knowledge-sharing on flood rescue activities, as well as for volunteer management during flood response will be introduced. A common training framework and a coordination tool is to be developed and piloted.

Project proposal was submitted to DTP 3rd call by a consortium of 15 partners and 5 ASPs from 7 countries and it was rejected by DTP.

7.20 InterFloodCourse project

A curriculum and teaching material for an international postgraduate course on flood risk management to harmonize methodologies and foster academic mobility of engineers in training within the Danube region operative flood management bodies was prepared with the involvement of experts from 6 DRB countries. Additional information is provided in the DFRMP chapter 5.5.6.5

More information: <https://vtk.uni-nke.hu/oktatas/interfloodcourse>

More information: <https://www.danubeenvironmentalrisks.eu/interfloodcourse>

The project has been finished.

7.21 SHELTER

Sustainable Historic Environments hoListic reconstruction through Technological Enhancement and community based Resilience - SHELTER project (<https://shelter-project.com/>), approved by EU

Horizon 2020 Programme aims at developing a data driven and community-based knowledge and operational framework that will bring together the scientific community and heritage managers with the objective of increasing resilience, reducing vulnerability and promoting better and safer reconstruction in Historic Areas to cope with climate change and natural hazards.

The Shelter project team coordinated by the Fundacion Tecnalia Research & Innovation is formed by a multidisciplinary and complementary consortium of 23 partners.

All the developments of the project will be validated in 5 open labs (case studies), representative of main climatic and environmental challenges in Europe and different heritage's typologies.

The Sava River basin is one of Shelter's open labs jointly coordinated by the International Sava River Basin Commission and UNESCO Regional Bureau for Science and Culture in Europe. A need for the spatial layer on cultural-historical heritage, in the format of Sava GIS, was recognized within the development of Sava FRMP and therefore the project will aim to collect input data on the cultural-historical heritage from the relevant national institutions. The collected data will be consolidated in a properly structured way for storing in Sava GIS for the purpose of processing and managing by the Sava Geoportal to be able to create and support services-based data exchange. Using collected data, the flood impact analysis is going to be performed on one or a few the most vulnerable CH sites within the areas of mutual interest for flood protection in the Sava River basin (AMIs).

Also networking between different sectors (water/floods, cultural-historical heritage and emergency management) and the continuous exchange of knowledge, best practices and facilitate peer-learning processes to raise awareness will be performed.

The project, with duration of 48 months, was officially launched on June 01, 2019.

7.22 WACOM

The main objective of the Water Contingency Management in the Sava River Basin - WACOM project (<http://www.interreg-danube.eu/approved-projects/wacom>) is the reduction of environmental risks related to accidental pollution and floods, especially with potential transboundary impact by improved cooperation of key actors and jointly developed common operational system for activating the accident management protocols within the Sava River Basin. It will focus on the implementation of three multilateral protocols regarding the flood protection, entered into force in 2015, on prevention of water pollution caused by navigation, entered into force in 2017 and on emergency situation where the final harmonization will take place in 2020.

The specific objectives of the WACOM project are

- Improved preparedness and management of the response (coping capacity) of all involved stakeholder during the pollution and flood incidents with improved definition of roles, and response assignments.
- Capacity building and transnational stakeholder dialogue defining common operational environment of all stakeholders.

- Development of integrative tools enabling more efficient and therefore more effective transnational preparedness and response in the case of water disasters, especially by common situational awareness.
- Filling the identified gap between the two pillars of floods/accidental pollution response institutions – to the complexity of the transnational response on the same river basin an additional complexity – cooperation between water management institutions and disaster management institutions (e.g. civil protection) is imposing another challenge, which will be addressed by the project.

The Lead partners is the University of Ljubljana, while the project partners are institutions responsible for water management, civil protection, and navigation from the Parties to the Framework Agreement on the Sava River Basin (SI, HR, BA and RS) and the International Sava River Basin Commission (ISRBC).

The project started in July 2020 and ends in December 2022.

Bilateral agreements on flood risk management in the DRBD

Annex 4 of the DFRM Plan

AustriaWith Germany

Interstate treaty between the Republic of Austria on the one hand and the Federal Republic of Germany and the European Economic Community on the other hand on the cooperation regarding water management in the Danube River catchment (BGBl. Nr. 17/1991).

The instrument of ratification signed by the Austrian Federal President and countersigned by the Austrian Federal Chancellor was exchanged on 14th December 1990 and referring to Art. 12 (2) came into effect on 1st March 1991.

Vertrag zwischen der Republik Österreich einerseits und der Bundesrepublik Deutschland und der Europäischen Wirtschaftsgemeinschaft andererseits über die wasserwirtschaftliche Zusammenarbeit im Einzugsgebiet der Donau (BGBl. Nr. 17/1991)

Die vom Bundespräsidenten unterzeichneten und vom Bundeskanzler gegengezeichneten Ratifikationsurkunden wurden am 14. Dezember 1990 ausgetauscht; der Vertrag tritt gemäß seinem Art. 12 Abs. 2 mit 1. März 1991 in Kraft

With Republic of Slovakia

Agreement between the Republic of Austria and Czechoslovakian Socialist Republic regarding water management of transboundary rivers. (BGBl. Nr. 106/1970, idF. BGBl. Nr. 1046/1994 – Further application with Slovak Republic)
The instruments of ratification had been exchanged on 16th February 1970. The agreement came into effect by 18th March 1970 referring to Art. 22 (2).

Vertrag zwischen der Republik Österreich und der Tschechoslowakischen Sozialistischen Republik über die Regelung von wasserwirtschaftlichen Fragen an den Grenzgewässern (BGBl. Nr. 106/1970, idF. BGBl. Nr. 1046/1994 - Weiteranwendung des Vertrages im Hinblick auf die Slowakische Republik)

Die Ratifikationsurkunden zum vorliegenden Vertrag sind am 16. Feber 1970 ausgetauscht worden; der Vertrag ist somit gemäß seinem Artikel 22 Absatz 2 am 18. März 1970 in Kraft getreten.

With Czech Republic

Agreement between the Republic of Austria and Czechoslovakian Socialist Republic regarding water management of transboundary rivers. (BGBl. Nr. 106/1970, idF. BGBl. Nr. 1046/1994 – Further application with Czech Republic)
The instruments of ratification had been exchanged on 16th February 1970. The agreement came into effect by 18th March 1970 referring to Art. 22 (2).

Vertrag zwischen der Republik Österreich und der Tschechoslowakischen Sozialistischen Republik über die Regelung von wasserwirtschaftlichen Fragen an den Grenzgewässern (BGBl. Nr. 106/1970, idF. BGBl. Nr. 1046/1994 - Weiteranwendung des Vertrages im Hinblick auf die Tschechische Republik)

Die Ratifikationsurkunden zum vorliegenden Vertrag sind am 16. Feber 1970 ausgetauscht worden; der Vertrag ist somit gemäß seinem Artikel 22 Absatz 2 am 18. März 1970 in Kraft getreten.

With Republic of Slovenia / Mura River

Agreement between the Republic of Austria and the Federal People's Republic of Yugoslavia regarding the water management of the Mura River (BGBl. Nr. 119/1956, Republic of Slovenia Slowenien – further application, BGBl. Nr. 714/1993, Republic of Croatia – no further application, BGBl. Nr. 474/1996)

The instruments of ratification had been exchanged and came into force on/by 9th February 1956.

Abkommen zwischen der Republik Österreich und der Föderativen Volksrepublik Jugoslawien über wasserwirtschaftliche Fragen der Mur-Grenzstrecke und der Mur-Grenzgewässer (Mur-Abkommen)

Da der Austausch der Ratifikationsurkunden am 9. Feber 1956 vorgenommen wurde, ist das Abkommen gemäß seinem Artikel 11 am 9. Feber 1956 in Kraft getreten.

With Republic of Slovenia / Drava River

Governmental agreement between the Republic of Austrian and the Federal People's Republic of Yugoslavia regarding the water management of the Drava River. After approval of the governments the agreement came into effect by 15th January 1955.

„Regierungsübereinkommen vom 25. Mai 1954 zwischen Österreich und Jugoslawien über Wasserwirtschaftliche Fragen an der Drau“ [HARTIG 1955]. „Nach Vorliegen der Genehmigung der Regierungen ist durch Notenwechsel festgelegt worden, dass als erster Tag der Wirksamkeit der 15. Jänner 1955 angesehen wird“ [HARTIG 1955]

Hungary

Agreement between the Austrian Republic and the People's Republic of Hungary regarding the water management in the border region. (BGBl. Nr. 225/1959) The agreement came into effect by 31st July 1959.

Vertrag zwischen der Republik Österreich und der Ungarischen Volksrepublik über die Regelung der wasserwirtschaftlichen Fragen im Grenzgebiet (BGBl. Nr. 225/1959) Dieser Vertrag ist gemäß seinem Artikel 22 am 31. Juli 1959 in Kraft getreten.

Switzerland

Interstate treaty of between the Republic of Austria and the Swiss Confederation on the regulation of the Rhine from the Ill mouth to the Lake Constance. (StF: BGBl. Nr. 178/1955) The instruments of ratification had been exchanged and came into effect on/by 22nd July 1955.

Staatsvertrag der Republik Österreich mit der Schweizerischen Eidgenossenschaft über die Regulierung des Rheines von der Illmündung bis zum Bodensee
Da der Austausch der Ratifikationsurkunden am 22. Juli 1955 stattgefunden hat, ist der Vertrag gemäß seinem Art. 35 an diesem Tag in Kraft getreten.

Liechtenstein

Agreement between the Republic of Austria and the Principdom of Liechtenstein on the definition of common principles of the regulation of the Rhine from the Swiss-Liechtenstein boarder to the Ill mouth, as well as the regulation of the discharge of inland waters. (StF: BGBl. Nr. 333/1931) The instruments of ratification had been exchanged by 20th of October 1931. Referring to Art. 14 the agreement came into effect on 17th November 1931.

Vertrag zwischen der Republik Österreich und dem Fürstentume Liechtenstein über die Festlegung gemeinsamer Grundlagen für die Regulierung des Rheins von der schweizerisch-liechtensteinischen Staatsgrenze bis zur Mündung des Illflusses, sowie über die Regelung der Ableitung liechtensteinischer Binnengewässer auf liechtensteinischem und österreichischem Gebiete und über die damit zusammenhängende Regulierung des Spirsgrabens, des Frickgrabens und der Esche.

Der Austausch der Ratifikationsurkunden hat am 20. Oktober 1931 stattgefunden. Der Vertrag tritt daher gemäß seinem Artikel 14 am 17. November 1931 in Kraft.

Bosnia and Herzegovina

Type of document	Counterpart Country	Title	Issued (year)	Subject
Agreement	Republic of Serbia	Agreement between Council of Ministers of Bosnia and Herzegovina and the Republic of Serbia on cooperation in protection against natural and other disasters (ratified in 2011)	Official Gazette of BH no 8/11.	Transboundary Early warning system cooperation
Agreement	Montenegro	Agreement on Cooperation in protection from natural and other disasters, between Council of Ministers of B&H and Montenegro Government (signed in 2007 and ratified in 2008)	Official Gazette of BH no 2/08.	Transboundary Early warning system cooperation
Agreement	Republic of Croatia	Agreement between the Croatian Government and the Government of Bosnia and Herzegovina on the regulation of water management relations (signed 11 July 1996 in Dubrovnik)	Official Gazette of BiH no 6/96.	Transboundary water management
Agreement	Republic of Croatia	Agreement between the Council of Ministers of Bosnia and Herzegovina and the Croatian Government on cooperation in the protection of natural and manmade disasters	Official Gazette of BiH no 7/01.	Transboundary Early warning system cooperation
Agreement	Republic of Slovenia	Agreement between the Council of Ministers and the Government of the Republic of Slovenia on cooperation in the protection of natural and manmade disasters	Official Gazette of BiH no 3/12.	Transboundary Early warning system cooperation

BulgariaWith Romania

Agreement between the Ministry of Environment and Water of the Republic of Bulgaria and the Ministry of Environment and Water Management of Romania on Cooperation in the Field of Water Management, signed on 12 November 2004 in Bucharest, entry into force on 15 March 2005.

With Serbia

A draft bilateral agreement with Serbia is at the final stage of preparation by Bulgarian competent authorities, to be proposed officially to the Serbian authorities via diplomatic channels. The proposed draft is entitled “Agreement between the Ministry of Environment and Water of the Republic of Bulgaria and the Ministry of Agriculture and Environmental Protection of the Republic of Serbia on Cooperation in the Field of Water Management”.

CroatiaWith Slovenia:

Treaty between the Government of the Republic of Slovenia and the Government of the Republic of Croatia on regulation of water management relations.

With Hungary:

Agreement between the Government of the Republic of Hungary and the Government of the Republic of Croatia about the issues in cooperation in water management.

With Bosnia and Herzegovina:

Agreement between the Croatian Government and the Government of Bosnia and Herzegovina on the regulation of water management relations.

Agreement between the Council of Ministers of Bosnia and Herzegovina and the Croatian Government on cooperation in the protection of natural and manmade disasters.

Monte Negro

Agreement between the Government of the Republic of Croatia and the Government of Monte Negro in the field of Water Management

With Serbia:

No bilateral agreements with the Republic of Serbia. The responsible Ministry is involved in the formulation of agreements and the commencement of a negotiation process with neighbouring countries.

Multilateral:

Framework Agreement on the Sava River Basin among: Bosnia and Herzegovina, Republic of Croatia, Republic of Slovenia and Republic of Serbia.

Czech RepublicWith Slovakia:

Dohoda mezi vládou České republiky a vládou Slovenské republiky o spolupráci na hraničních vodách - podepsána dne 16. prosince 1999 a ve stejný den vstoupila v platnost

The Agreement between the Governments of the Czech Republic and the Slovak Republic on cooperation on transboundary waters

Směrnice pro předpovědní, hláskou a varovnou službu na česko-slovenských hraničních vodních tocích
Implementation for forecasting, reporting and warning service on the Czech-Slovak transboundary waters

With Austria:

Smlouva mezi Československou socialistickou republikou a Rakouskou republikou o úpravě vodohospodářských otázek na hraničních vodách ze dne 7. prosince 1967, platnou od 18. března 1970

Convention between the Czechoslovak Socialist Republic and the Republic of Austria on the settlement of water management issues concerning transboundary waters signed on December 7, 1967 and came into force on March 18, 1970.

Směrnice pro varovnou službu na česko-rakouských hraničních vodách
Directive for warning service on Czech- Austrian transboundary waters.

GermanyWith Austria

Interstate contract between the Republic of Austria on the one hand and the Federal Republic of Germany and the European Economic Community on the other hand on the cooperation regarding water management in the Danube River catchment.

The instrument of ratification signed by the Austrian Federal President and countersigned by the Austrian Federal Chancellor was exchanged on 14th December 1990 and referring to Art. 12 (2) came into effect on 1st March 1991.

Moldova

Coordination of the flood risk management between Moldova and Romania, and Moldova and Ukraine takes place through several agreements and regulation such as:

- Agreement between the Government of the Republic of Moldova and the Government of Romania on cooperation and mutual assistance in case of disasters (signed in Iasi on March 3, 2012), ratified in the Republic of Moldova by Law no. 196/2012, in RO - by Law no. 65/2013;
- Government Decision no. 853/1999 regarding the Opening of the international road traffic on the dam of the Costești - Sfîncă Hydro-technical Node on the Prut River;

- Agreement between the Government of the Republic of Moldova and the Cabinet of Ministers of Ukraine on cooperation in the field of prevention of industrial damage, catastrophes, natural disasters and liquidation of their consequences (signed in Kiev on August 4, 1998), approved by Government Decision no. 975/1998;
- Regulation on the classification of emergency situations and on the manner of accumulation and presentation of information about protection of population and territory in the case of emergency situations, approved by Government Decision no. 1076/2010;
- Agreement between the Government of the Republic of Moldova and the Government of Romania on cooperation for the protection and sustainable use of water resources of the Danube and Prut, signed in Chisinau on June 28, 2010, ratified by Government Decision no. 1071/2010. Agreement is implemented by inter-governmental Hydro-technical Commission established in 2010, which composed of 4 sub-committees: i) for the operation and maintenance of the Costești-Stânca Hydro-technical Node, ii) for protection against floods and frosts, iii) for quantitative water management and hydrometeorology, and iv) for the protection of water quality and biodiversity of water bodies. The Commission represents the focal point of cooperation and coordination in the field of floods between the two parties, Romania and the Republic of Moldova. The Commission coordinates the work on the implementation of the European Floods Directive, as well as the harmonization of flood risk management plans. Usually, the coordination of activities is carried out through written communications, but in case of emergency situations the co-chairs of the commission get in touch by phone, and the established ones will be transmitted by written communications.

Moldovan institutions responsible for intervention in case of floods are: Commission for Emergency Situations; General Inspectorate for Emergency Situations; Ministry of Agriculture, Regional Development and Environment; Agency "Apele Moldovei"; State Hydro-meteorological Service; Ministry of Health, Labor and Social Protection; National Agency for Public Health; Environment Agency; Inspectorate for Environmental Protection.

Montenegro

No information provided

Romania

Bilateral cooperation Romania – Ukraine

Cooperation shall be conducted under the Agreement between the Government of Romania and the Government of Ukraine on cooperation in border water management (Galati, 30 September 1997), ratified by the Romanian Parliament by Law no. 16 of 11 January 1999.

Activities for implementing the Agreement shall take place within the next three working groups, one for each important river:

1. Working group to resolve issues of Tisza River and its tributaries in the border area.
2. Working group to resolve issues of Siret and Prut in the border area.
3. Working group to resolve issues of Danube on the common border area.

Bilateral cooperation Romania – Hungary

The first agreement in water field between Romania and Hungary was signed in Bucharest on 14 April 1924 and was in force until 1945. This was followed by 4 cycles of cooperation, 1945-1961, 1962-1965, 1965-1970, 1970 to 1986, the agreement was renewed every time. On 25 June 1986 was signed in Bucharest Convention between the Government of Romania and the Republic of Hungary on the regulation of issues related to hydraulic structures on water which form or cross the border. The Convention entered into force November 20, 1986.

Currently, cooperation is performed under the Agreement between Romania and the Republic of Hungary on cooperation for the protection and sustainable use of water in the border region (Budapest, September 15, 2003), ratified by Government Decision no. 577/15.04.2004.

The agreement applies to the following rivers: Tur, Somes, Crasna, Barcau, Ier, Crisul Repede, Crisul Negru, Crisul Alb and Mures by hydrotechnical Romanian-Hungarian Commission.

For carrying out the agreement, the Commission has established the following standing Subcommittees areas:

1. Coordination and development cooperation Subcommittee;
2. Subcommittee on Water Management and Hydrometeorology;
3. Subcommittee on water quality;
4. Subcommittee on flood defence.

Subcommittees carry out the decisions of the Commission, the tasks resulted from regulations act independently within the provisions of the Regulations for measures to be taken immediately and assures the continuity of technical activity based on the Agreement.

Bilateral cooperation Romania – Serbia

Cooperation is achieved until 2020 under the Agreement between the Romania and RPF Yugoslavia on hydraulic problems in hydraulic systems and watercourses that cross the border or are the border (Bucharest, April 7, 1955), ratified by Decree no. 242/17.06.1955 and entered into force in 30 June 1955.

In 5 June 2019, a new agreement between Romania and Serbia regarding cooperation on sustainable cross-border water management was signed and entered into force in 1 September 2020. It was approved by the Government Decision no. 725/27 August 2020.

The agreement applies to the following rivers: the Danube, Nera, Moravita, Aranca, Bega Veche, Bega Channel, Timis, Caras and Nera by hydrotechnical Romanian-Serbian Commission.

For carrying out the agreement, the Commission has established the following standing Subcommittees areas:

1. Subcommittee for water quality;
2. Subcommittee on hydrometeorology and quantitative water management;
3. Subcommittee on flood defence and ice.

The previous regulations and methodologies in accordance with the “Agreement between the Romanian People's Republic and the Federal People's Republic of Yugoslavia on Hydrotechnical Issues on hydrotechnical systems and watercourses on the border or intersected by the state border” (Bucharest, 1955) remains as follows:

1. Operation rules of the Romanian-Yugoslav Hydrotechnical Commission, 1956 (adopted at the first session of the Romanian-Yugoslav Joint Commission, 1956);
2. The common regulation of flood protection on watercourses and hydrotechnical systems which form or are crossed by the Romanian-Yugoslav state border (adopted at the XVIII-th Session of the Romanian-Yugoslav Joint Hydrotechnical Commission, 1971, as subsequently amended and supplemented);
3. Operation rules of the Tomasevat weir (adopted at the XXIII-th Session of the Joint Commission Romanian-Yugoslav on hydrotechnics, 1980);
4. Methodology of joint examination of water quality in the border watercourses profiles that form or are crossed by the Romanian-Yugoslav state border (adopted at the XXIX Session of the Joint Committee Romanian-Yugoslav on hydrotechnics, 1998)

A special agreement regarding Iron Gates I and II exists also, named “The Convention between the Government of Romania and the Federal Government of the Federal Republic of Yugoslavia on the operation and maintenance of hydropower and navigation systems of Iron Gates I and II” signed in Drobeta-Turnu Severin in 1998.

Bilateral cooperation Romania - Bulgaria

Cooperation is achieved under the Agreement between the Ministry of Environment and Water Management of Romania and the Ministry of Environment and Water of the Republic of Bulgaria on cooperation in the field of water management (Bucharest, November 12, 2004), ratified by Government Decision no. 2419/21.12.2004.

The agreement applies to the Romanian-Bulgarian Joint Commission through the following three working groups:

1. Working Group for river basin water management;
2. Working Group on Danube;
3. Working Group on the Black Sea.

Bilateral cooperation Romania – Moldova

Cooperation is achieved under the Agreement between Romania and the Republic of Moldova on cooperation for the protection and sustainable use of water - Prut and Danube (Chisinau, 28 June 2010) approved by Government Decision no. 1092/2.11.2010.

Application of the Agreement shall be made by the Intergovernmental Hydrotechnical Committee on subcommittees established for the following fields:

1. Subcommittee on operation and maintenance of hydraulic Stanca-Costesti reservoir;
2. Subcommittee on flood defence and ice;
3. Subcommittee on quantitative water management and hydrometeorology;
4. Subcommittee on water quality and biodiversity protection of water bodies.

Serbia

With HUNGARY:

Agreement between the Government of the Republic of Serbia and the Government of Hungary on cooperation in the field of sustainable management of transboundary waters and river basins of common interest, signed in Subotica on 15 April 2019.

It was ratified by the National Assembly of the Republic of Serbia through the Law of Confirmation of the Agreement (“Official Gazette of the RS - International Agreement”, No. 4/2020). It came into force on 24 April 2020.

With ROMANIA:

- The agreement between the governments of FPR of Yugoslavia and the PR of Romania concerning water engineering issues related to boundary and transboundary systems and watercourse, entered into force on 7 April 1955.
 - Agreement between the Government of the Republic of Serbia and the Government of Romania on cooperation in the field of sustainable transboundary water management signed on 5 of June 2019. The Law on Ratification of the Agreement between the Government of the Republic of Serbia and the Government of Romania on Cooperation in

the Sustainable Management of Transboundary Waters ("Official Gazette of the RS - International agreements", No. 4/2020) was ratified by the National Assembly of Republic of Serbia.

- Several agreements and conventions governing the construction, operation and maintenance of the Iron Gate Hydro Power and Navigation System Djerdap were entered into force by Yugoslavia and Romania in 1963, 1964, 1967, 1976, 1977, 1987, and 1998.

With BULGARIA:

The agreement between the governments of the FPR of Yugoslavia and the PR of Bulgaria concerning water management issues, entered into force on 4 April 1958. The agreement is formally in force, but cooperation was discontinued in 1982.

With other neighbouring countries:

No bilateral agreements with the Republic of Croatia, Bosnia & Herzegovina, Republic of North Macedonia and Montenegro. The responsible Ministry has initiated extensive preparations for the formulation of agreements and the commencement of a negotiation process with neighbouring countries. Draft agreements were submitted to Bosnia & Herzegovina and Croatia in 2018.

Slovak Republic

Bilateral cooperation of the Slovak Republic (SR) on the border sections of the rivers – valid intergovernmental treaties and agreements:

With AUSTRIA:

Treaty between Czechoslovak Socialist Republic and Republic of Austria on the regulation of water management issues at the border waters (signed 7.12.1967 in Vienna, valid since 18.3.1970, inherited with partners after the formation of the SR in 1993, Treaty between SR and Republic of Austria currently in the ratification process).

The confirmation of status of contractual base between Slovak republic and Austrian republic after succession of Slovak republic into contracts of former Czech and Slovak federative republic published as Notice of Foreign Ministry of SR No. 369/2000 Collection of Laws.

With CZECH REPUBLIC:

Intergovernmental agreement between SR and Czech Republic on the cooperation at the border waters (signed 16.12.1999 in Zidlochovice, valid since 16.12.1999)

With HUNGARY:

Intergovernmental agreement between Czechoslovak Socialist Republic and People's Republic of Hungary on the regulation of water management issues at the border waters (signed 31.5.1976 in Budapest, valid since 31.7.1978, inherited with partners after the formation of the SR in 1993, Treaty between SR and Republic of Hungary is ratified

Contracts between Slovak republic and Hungarian republic on regime and cooperation in common state border published as Notice of Foreign Ministry of SR 269/1996 Collection of laws

With POLAND:

Intergovernmental agreement between SR and Republic of Poland on the water management at the border waters (signed 14.5.1997 in Warsaw, valid since 6.12.1999)

With UKRAINE:

Intergovernmental agreement between SR and Ukraine on the water management issues at the border waters (signed 14.6.1994 in Bratislava, valid since 15.12.1995). It was published as Notice of Foreign Ministry No. 38/1996 Collection of laws.

Slovenia

With AUSTRIA:

Agreement between the Government of the Federal People's Republic of Yugoslavia and Federal Government of Austria on water management issues of the Drava river (Official Gazette of Federal People's Republic of Yugoslavia – MP 1-8/1955)

Agreement between the Federal People's Republic of Yugoslavia and the Republic of Austria on water management issues of the border section and the border waters of the Mura river (Official Gazette of Federal People's Republic of Yugoslavia – MP 10-49/1956)

With HUNGARY:

Agreement between the Government of the Republic of Slovenia and the Government of the Republic of Hungary on regulation of water management issues (Official Gazette of the Republic of Slovenia – MP 2/95)

With CROATIA:

Treaty between the Government of the Republic of Slovenia and the Government of the Republic of Croatia on regulation of water management relations (Official Gazette of the Republic of Slovenia – MP 23/97)

Agreement on cooperation for the protection of the Adriatic Sea and the coastal area from pollution (Official Gazette of the Socialist Federal Republic of Yugoslavia – MP 2/1977)

With ITALY:

Agreement on the permanent Yugoslav-Italian commission on water management (Official Gazette of the Socialist Federal Republic of Yugoslavia – MP 9/80)

Agreement on cooperation for the protection of the Adriatic Sea and the coastal area from pollution (Official Gazette of the Socialist Federal Republic of Yugoslavia – MP 2/1977)

The minutes of all Slovenian bilateral commission meetings/sessions are available at:

<http://www.evode.gov.si/index.php?id=92>

Ukraine

The Tisza River Basin Water Resources Directorate (of the State Agency of Water Resources of Ukraine) is engaged in implementation of the Bilateral Intergovernmental Water Management Agreements in partnership with the Upper-Tisza Water Directorate (of the General Directorate of Water Management of Hungary), Kosice Water Management Directorate (of the Slovak Water Management Administration) and Somes-Tisa Water Directorate (of the National administration “Romanian Waters”), based on:

- the Agreement between the Government of Ukraine and the Government of Hungary on water management on boundary waters (Budapest, Hungary, 1997),
- the Agreement between the Government of Ukraine and the Government of Slovak Republic on water management on boundary waters (Bratislava, Slovak Republic, 1994),
- the Agreement between the Government of Ukraine and the Government of Romania on cooperation in the field of water management on boundary waters (Galati, Romania, 1997).

These bilateral agreements comprise the issues of flood protection, water resources management, water quality assessment and ecological monitoring, hydro-meteorological information exchange on boundary waters.

Living Danube Partnership FY2020 Report

June 2020

WORKING
TOGETHER
FOR A LIVING
DANUBE

Summary

Expected results by 2021:

5,996

hectares of wetlands restored

17.52

million m³ of water replenished.

As we head into the final year of the seven-year Living Danube Partnership (2014-2021), we are on track to achieve all of our targets for river and wetland restoration as well as communications and engagement. While the Covid-19 pandemic has caused delays and forced us to change plans particularly for awareness and engagement, we still expect to achieve all results by the end of June 2021 as planned.

River and wetland restoration is completed in 5 projects, with another 3 to be finished within the next year and one more by 2022. Despite delays, the current pipeline of projects across six countries of the Danube basin is on track to deliver 17.52 million m³ of water replenished by 2021 (16.53 million m³ directly financed by The Coca-Cola Foundation, versus 12 million m³ target) and 5,996 hectares of wetlands restored (vs 5,327 ha target).

Outreach and awareness activities are on track or have exceeded targets. Through the Living Danube Tour travelling exhibit and other events, to date we have reached more than 86,094 of the 120,000 people we plan to reach directly. Indirectly, via traditional and social media, we have reached over 56 million people to date, well in excess of our 5 million target, with another 12 million projected by the end of next year. Outreach and sharing lessons with decision makers, experts and stakeholders will be a major focus for the last year of the partnership.

Thanks to its long-term commitment and flexible approach, the partnership has helped raise an additional €7.65 million for wetland conservation and restoration directly, by co-financing EU-funded projects; and over €11.33 million indirectly, by providing staff time and support for development of further initiatives. Beyond this, the Partnership has inspired stakeholders to undertake additional restoration projects, e.g. of further soda lakes at Neusiedler See or at Kalimok in Bulgaria.

At issue: Danube wetlands

80%

of Danube wetlands have been lost – and with them many fish populations

More than 80% of wetlands and floodplains of the Danube River and its main tributaries have been lost, and with them the ecosystem goods and services they provide, from fish and wildlife to flood and drought management. Fortunately, there is a growing appreciation of rivers and wetlands, and government commitments to not only conserve what remains, but also to restore what we have lost. However, actually restoring these areas involves a painstaking process of stakeholder engagement that can take years before actual measures like breaching dykes can be undertaken. As a result, most commitments to wetland restoration in the Danube basin remain on paper and not realised in practice.

The Living Danube Partnership addresses this challenge of implementation through implementation, advocacy and promotion.

WORKING
TOGETHER
FOR A LIVING
DANUBE

Living Danube Partnership

Our targets:

4,800

Olympic-sized swimming pools
of water replenished

7,422

Football pitches of wetlands
restored

The Living Danube Partnership brings together WWF-CEE, Coca-Cola with the support of The Coca-Cola Foundation and the International Commission for the Protection of the Danube River (ICPDR) to promote the conservation and restoration of wetlands in the Danube basin. Supported by a \$4.4 million grant from The Coca-Cola Foundation, the seven-year (2014-21) partnership is working closely with local stakeholders and relevant authorities to connect river stretches or floodplains to the river system by opening dams, installing sluices for water retention or by restoring water supply channels. At the same time, a regional movement is being created for wetland conservation and restoration, as well as good water stewardship.

A unique, cross-sectoral partnership

The Living Danube Partnership harnesses the mandate of the ICPDR, the capacity and resources of Coca-Cola and The Coca-Cola Foundation, and the facilitation and expertise of WWF-CEE to promote river and wetland restoration in the Danube basin, for people and nature.

WORKING TOGETHER FOR A LIVING DANUBE

ICPDR IKSD International Commission for the Protection of the Danube River

River and wetland restoration

Most of the restoration projects directly supported through the Living Danube Partnership have been completed. Three are expected to be completed in 2020 or in spring 2021: Garla Mare, Vrata and restoration of the Lankoc floodplain forest. A final project focused on restoring a number of side-arms of the Drava River in Croatia, where the Living Danube Partnership has leveraged significant EU support, will not be completed until 2022.

6,9

The Living Danube Partnership includes river and wetland restoration initiatives across 6 countries, 9 projects and over 20 individual sites.

Results: Restoration & replenishment

We expect to exceed our original targets for both wetland restoration and volume of water replenished. The greatest areas and volumes will be delivered by completed restoration projects at Persina and Kalimok marshes in Bulgaria and by restoration projects at Garla Mare and Vrata in Romania, which are expected to be completed in 2020. Other projects with limited area or volume are nevertheless important for biodiversity or as pilots – e.g. restoration of small but exceptional soda lakes at Neusiedler See, or the pioneering of fish passes on the Rusenski Lom river in Bulgaria.

5,996

hectares of wetlands are expected to be restored by 2021.

17.52

million cubic meters of water are expected to be replenished by 2021.

Table: Living Danube Partnership – River and wetland restoration achievements to date and planned

	2015	2016	2017	2018	2019	2020	2021	Forecast total	Original Target

Overview of restoration projects

NEUSIEDLER SEE • AUSTRIA / Neusiedler See National Park

Soda lakes are a rare type of wetlands that support unusual wildlife, including seabirds many kilometers from the sea. In Europe, they only exist in the Pannonian Basin, stretching from eastern Austria across Hungary to Serbia. Hundreds of the lakes have lost their unique character due to man-made interventions, including drainage. By installing a system of sluices, the Danube Partnership has raised the level of groundwater, preventing some of the soda lakes from drying out.

The successful project – the first to be completed under the Living Danube Partnership in 2016 – has inspired local stakeholders to undertake additional interventions to save other soda lakes in the area, including preparation of a large EU LIFE project for soda lake restoration by the Neusiedler See National Park; and a restoration project for 6 small soda lakes, submitted to the EU LEADER programme in partnership with the local hunting association.

ŠIROKI RIT • SERBIA / Mura-Drava-Danube Biosphere Reserve

Since the second half of the 18th century, Široki Rit in northern Serbia was free of forest vegetation thanks to regular flooding. This changed in the second half of the 20th century, when efforts to regulate the Danube prevented regular flooding and led to gradual drying and siltation of the area. Widening and deepening the existing supply channel and slightly dredging the lake has given the area the possibility to fulfil its primary ecological function as a breeding and spawning area for waterfowl, fish and amphibians and a stopover for migrating birds. The area has attracted an additional nesting pair of rare White-tailed eagles since completion of restoration works in 2017.

WORKING
TOGETHER
FOR A LIVING
DANUBE

Overview of restoration projects

BARCS OLD DRAVA OXBOW • HUNGARY/CROATIA

Mura-Drava-Danube Transboundary Biosphere Reserve

Several oxbows have been created as a result of natural as well as man-made changes to the main channel of the Drava River. The Barcs Old Drava, the longest side-branch of the river in Hungary (15 km), has suffered from declining water levels that have hurt the ecology of the area as well as fishing. The Living Danube Partnership contributed co-financing for an EU-funded project to restore water levels and floodplain forest habitats through construction of a bottom-weir (with fish pass) and to improve infrastructure for angling. The intervention, which was completed in 2017, involved cross-border cooperation with Croatia.

DRAVA RIVER SIDE ARMS • CROATIA

Mura-Drava-Danube Transboundary Biosphere Reserve

In many places along the Danube and Drava rivers, natural side arms have been historically separated from the main channel. These man-made modifications lead to negative results including the deterioration of the side-arm ecology, the loss of effective floodplain and the increased riverbed incision of the main river channel mainly due to changed river flows and reduced sediment transport. Co-financing from the Living Danube Partnership is leveraging EU support – the first EU LIFE Nature-funded project in Croatia -- to restore six side-arms of the Drava River in Croatia. The project, which is led by the Croatian Water Authority, is designed to give the Authority experience in 'natural' river management while helping Croatia comply with the EU Water Framework Directive and the requirements of the EU Habitats and Birds Directives. To date, detailed planning has been completed, but implementation has been delayed by permitting procedures and the Covid-19 pandemic and is not expected to be completed until 2023. Two riverine species have been reintroduced to the area and habitat monitoring is ongoing.

of the Danube River

Overview of restoration projects

LANKÓC FLOODPLAIN FOREST • HUNGARY

Mura-Drava-Danube Transboundary Biosphere Reserve

The overall goal of the project is to reduce riverbed degradation of the Drava River through changes to the existing river regulation structures and management. This will improve the status of riverine and floodplain habitats and, among other benefits, improve the water supply of the Lankóc Floodplain Forest. Through staff costs to initiate and prepare the project as well as very limited co-financing (€5,938), the Living Danube Partnership has leveraged significant EU funding for project activities (€1.85 million). Construction of six water-regulation measures is expected to be completed in autumn 2020.

RUSENSKI AND CHERNI LOM RIVER • BULGARIA

Lower Danube Green Corridor

Many dams and other man-made barrages in Bulgaria do not have any or only inadequate fish passes. As a result, the natural free movement of fish has been severely restricted or stopped. The Living Danube Partnership provided co-financing for an EU-funded project that in 2017 restored over 120 km of river connectivity, including removal of 2 barriers and construction of a new fish pass. The pioneering project is being used to pilot and promote good practice in design and construction of fish passes in Bulgaria to permit the free movement of fish and restore endangered fish populations. Project activities have also included restocking of fish populations as well as education and awareness.

of the Danube River

Overview of restoration projects

PERSINA MARSH • BULGARIA / Lower Danube Green Corridor

Persina is the largest of the Belene islands, a complex of Danube islands in Bulgaria that are characterized by freshwater marshes, seasonally-flooded riverine forests and agricultural lands that are exceptionally rich in biological diversity. Protected as a Ramsar wetland site and part of the EU's Natura 2000 network of specially protected sites, the Belene complex hosts rare plants and globally threatened birds such as the Dalmatian pelican (*Pelecanus crispus*). Improvements to the system of sluices controlling water supply to the area that were completed in 2019 have improved regulation of water in the marshes of Persina Island (which is also home to a prison). Specially constructed platforms in the marsh have already been taken over by flocks of pelicans.

KALIMOK MARSH • BULGARIA / Lower Danube Green Corridor

For centuries Kalimok marsh, located to the west of the town of Tutrakan in northern Bulgaria, was one of the most important sites for commercial fishing in the Lower Danube. This changed after the marsh was drained and separated from the Danube in the 1950s, leading to a steep decline in fish production. Attempts to farm the area proved unsuccessful, so fish ponds were established, but by the 1990s these also had been abandoned. In 2007, new sluices were installed to reconnect the marsh to the Danube. With support through the Living Danube Partnership, in 2019 the water management system was optimised in the Kalimok marsh complex, which is now protected under both national and EU legislation. Wetland restoration in Kalimok and the nearby Persina marshes together has delivered some 7 million m³ in replenishment, i.e. well over half of our original target.

WORKING
TOGETHER
FOR A LIVING
DANUBE

Overview of restoration projects

GÂRLA MARE • ROMANIA / Lower Danube Green Corridor

The Garla Mare and Vrata restoration projects in Romania are together expected to generate as much or even more replenishment benefits as Persina and Kalimok in Bulgaria. Garla Mare is an area of marsh covering about 700 ha in a former side branch of the Danube River. Historically, the area was modified for fish farming, isolating the natural marsh from the river and dividing it with dykes. The water inundation of the area will be improved through modification of a water supply channel. Some dykes will be reinforced to protect active fish ponds against flooding, and reed-beds will be managed to improve the dynamics of the wetland habitat. Significant delays were caused by unexpected inconsistencies in the land cadastre. These have now been overcome and permitting is nearly complete, opening the way to implementation of measures in autumn 2020. The Garla Mare project is funded exclusively through the Living Danube Partnership and is expected to increase capacity for water retention by 5.2 million m³.

VRATA • ROMANIA / Lower Danube Green Corridor

Adjacent to and separated by a dyke from the Garla Mare wetlands, the Vrata site is similar in size and volume to its neighbour. A scoping study including modeling of a potential technical solution indicates a replenishment potential of between 2.8 and 6.7 million m³ of water depending on elevation of the terrain. The site also has added value due to the openness of the land concessionaire to develop his business based on the restoration work. Two sluices to the adjacent Garla Mare site will be installed. The site has only recently entered the pipeline of wetland restoration projects after analysing the restoration potential along the Lower Danube in Romania. It was chosen in preference to the Cetate restoration site, which had promising potential for wetland restoration but unclear and complicated land ownership that would have risked delays of completion.

Promoting a movement for wetlands

Beyond wetland restoration, the Living Danube Partnership seeks to promote a movement for wetlands in the Danube basin.

The focus is at three levels:

- Promotion and local stakeholder involvement around individual restoration sites and activities.
- Outreach to a wider audience, particularly young families, through organisation of a mobile exhibit, special events as well as through ongoing media, social media and internet.
- Advocacy and promotion of wetland conservation and restoration and water stewardship among experts and decision makers.

WORKING
TOGETHER
FOR A LIVING
DANUBE

Progress to date

56

million people have been reached with a message of rivers, wetlands and restoration

86

thousand people have been directly involved in events.

We are on track or have already exceeded our targets related to outreach and awareness raising.

Last year we further exceeded our original target for outreach (people reached indirectly via internet as well as traditional and social media), with over 46 million people reached through various channels compared with a 5 million target over the 7-year partnership. This was helped by a number of freshwater-related issues that we could use for communications and awareness, including a month-long joint communications campaign with Coca-Cola in September 2019 and the Europe-wide campaign to defend the EU Water Framework Directive.

In contrast, our engagement of people, particularly young families, through events was modest (8,094 vs 30,000 target for the year). This was largely due to the COVID-19 pandemic, which since March 2020 has forced the cancellation of festivals and other events that we had planned to attend. The resulting substantial cost savings will permit us to step up our engagement in 2020-21.

Our outreach to decision-makers continued, particularly through the official meetings of the International Commission for the Protection of the Danube River, some of which had to take place online.

Results to date and planned	Actual by FY2020 (cumulative)	FY2021 (plan)	By FY2021 (plan, cumulative)	FY2021 targets
# of people involved in restorations	1,995	300	2,295	2,100
# of people involved in events	86,094	50,000	136,094	120,000
# of people reached indirectly	56,120,936	12,000,000	68,120,936	5,000,000
# of expert publications	2	2	4	4
# of videos	22	5	27	5

WORKING TOGETHER FOR A LIVING DANUBE

ICPDR IKSD

International Commission for the Protection of the Danube River

A year of activity – cut by COVID-19

Many of our plans to participate in music and film festivals were frustrated by the COVID-19 pandemic. One event that did take place was the Big Jump in July in Hungary.

Coca-Cola added its voice to WWF and over 100 other organisations in defence of the EU's landmark water legislation.

Our mobile exhibit on freshwater and wetlands targeted young families, including interactive learning activities.

In October 2020 together with Coca-Cola Romania we organised a seminar on water and wetlands for the company's partners and employees. – a pilot for further business-targeted events planned for 2020-21.

In September 2019 we joined forces with Coca-Cola Europe to promote wetlands and the work of the Living Danube Partnership in traditional and social media.

Official meetings of the ICPDR continued to provide the best opportunities for advocacy and experience sharing with relevant decision-makers and experts across the Danube basin.

WORKING
TOGETHER
FOR A LIVING
DANUBE

The power of partnership

The Living Danube Partnership presents a unique model of cross-sectoral cooperation.

The long-term commitment and relationship of trust between the partners and focus on achieving overarching objectives and targets has provided the flexibility needed to realise technically complex and by their nature uncertain wetland restorations involving different landowners and users, authorities and other interests.

A steering group composed of representatives of the partners meets twice per year to review progress toward the targets and approve plans and budget allocations for the next year. They review the pipeline of restoration projects and other initiatives, deciding on adaptive management or additional activities where relevant.

Thanks to this flexible approach, the partnership has been able to adapt to inevitable challenges, including delays or dead ends where barriers to achieving wetland restoration have proven insurmountable. It has also been able to respond to opportunities, including leveraging significant additional support and activities for wetlands well beyond that originally envisaged. To date, the Living Danube Partnership has leveraged some €20 million in support for wetland and river restoration and related activities, including €7.65 million in direct support (e.g. by co-financing EU-funded projects) and €11.33 million indirectly (e.g. through provision of staff time for development of proposals).

€20 million

The Living Danube Partnership has leveraged €20 million for river and wetland restoration.

The final year of the Living Danube Partnership will be packed. Our focus will be both on pulling through and promoting the river and wetland restoration already planned as well as on leveraging these results for greater impact in the Danube basin and beyond. The ongoing Covid-19 pandemic has led to complications and some delays, but we remain confident that we will achieve activities and results by the end of June 2021 as planned.

Special events will be used to directly engage the public as well as targeted stakeholders such as the private sector on the importance of water and wetlands. Some of the events, including a business conference and seminars, are already planned to take place partly or wholly online. Original plans to focus on summer music festivals have been reduced to one festival that is still planned in Hungary.

Completion of the Garla Mare and Vrata projects in autumn 2020 will deliver major contributions toward our targets for water replenishment and wetland restoration. Restoration of the Lankoc forest floodplain is expected around the same time, while completion of restoration of the Drava side arms will take until 2022-23.

Thanks to the COVID-19 pandemic, there will be a relatively stronger focus on outreach via traditional and social media, focused around project milestones including completion of wetland restoration, the launch of a water footprint calculator or World Rivers Day and other anniversaries. A study on water will provide another touchpoint in the late summer.

A major focus will be sharing our results and experience with decision makers, experts and other stakeholders, mostly through conferences like the World Water Week. Official meetings of the ICPDR will provide opportunities to reach relevant decision makers and experts in the Danube basin.
